Mr. John E. Kieling
Bureau Chief
Hazardous Waste Bureau
New Mexico Environment Department
2905 Rodeo Park Drive East, Building 1
Santa Fe, NM 87505-6303

Dear Mr. Kieling:

Subject: Submittal of the Annual Periodic Monitoring Report for the Technical Area 16 260 Monitoring Group, Revision 1, and the Annual Periodic Monitoring Report for Material Disposal Area AB Monitoring Group, Revision 1

Enclosed please find two hard copies with electronic files of the "Annual Periodic Monitoring Report for the Technical Area 16 260 Monitoring Group, Revision 1," and the "Annual Periodic Monitoring Report for Material Disposal Area AB Monitoring Group, Revision 1."

This report is submitted in response to comments received from the New Mexico Environment Department (NMED) on September 18, 2018; copies of the comments are enclosed.

If you have any questions, please contact Steve Veenis at (505) 309-1362 (steve.veenis@em-la.doe.gov) or Hai Shen at (505) 665-5046 (hai.shen@em.doe.gov).

Sincerely,

for

Arturo Q. Duran
Compliance and Permitting Manager
Environmental Management
Los Alamos Field Office

Annual Periodic Monitoring Report for the Technical Area 16 260 Monitoring Group, Revision 1

N3B Los Alamos

Newport News Nuclear BWXT–Los Alamos, LLC (N3B), under the U.S. Department of Energy Office of Environmental Management Contract No. 89303318CEM000007 (the Los Alamos Legacy Cleanup Contract), has prepared this document pursuant to the Compliance Order on Consent, signed June 24, 2016. The Compliance Order on Consent contains requirements for the investigation and cleanup, including corrective action, of contamination at Los Alamos National Laboratory. The U.S. government has rights to use, reproduce, and distribute this document. The public may copy and use this document without charge, provided that this notice and any statement of authorship are reproduced on all copies.

EXECUTIVE SUMMARY

This annual periodic monitoring report (PMR) presents results for the Technical Area 16 260 (TA-16 260) monitoring group of the Newport News Nuclear BWXT-Los Alamos, LLC, groundwater monitoring program that have not been previously reported. All monitoring work reported in this PMR was conducted pursuant to the “Interim Facility-Wide Groundwater Monitoring Plan for the 2017 Monitoring Year, October 2016–September 2017” and the “Interim Facility-Wide Groundwater Monitoring Plan for the 2018 Monitoring Year, October 2017–September 2018,” both prepared in accordance with the Compliance Order on Consent.

This PMR presents monitoring results for four periodic monitoring events (PMEs) conducted during the third and fourth quarters of monitoring year (MY) 2017 and the first and second quarters of MY2018 and includes the monitoring of surface water, groundwater spring, and groundwater well or well screen locations. This PMR also includes any results from earlier TA-16 260 monitoring group PMEs that have not yet been reported because validated laboratory data were not available (in some cases because of data release agreements).

Groundwater and surface water samples collected during the PMEs were analyzed for metals; volatile organic compounds; semivolatile organic compounds; polychlorinated biphenyls; high explosives; dioxins and furans; radionuclides, including low-level tritium; general inorganic chemicals, including perchlorate; and field parameters (dissolved oxygen, oxidation-reduction potential, pH, specific conductance, temperature, and turbidity).

Four surface water analytical results reported in this PMR were above applicable screening values.

Fifty-six groundwater analytical results reported in this PMR were above applicable screening values.

1.0 INTRODUCTION

This annual periodic monitoring report (PMR) for the Technical Area 16 260 (TA-16 260) monitoring group provides documentation of the following groundwater periodic monitoring events (PMEs) conducted by Los Alamos National Laboratory (LANL or the Laboratory):

Watershed	PMEs Reported in this PMR		PME Field Sampling	
	MY*	Quarter	Begin	End
Water/Cañon de Valle and Pajarito	2017	3	05/31/17	06/15/17
		4	08/29/17	09/15/17
	2018	1	12/05/17	12/21/17
		2	02/06/18	02/23/18

*MY = Monitoring year.

The annual PMR for the TA-16 260 monitoring group is submitted to the New Mexico Environment Department (NMED) every August and includes TA-16 260 monitoring group PMEs performed through the second quarter of MY2018. During the third quarter of fiscal year 2018, environmental remediation work transitioned from the Laboratory, under the U.S. Department of Energy (DOE) National Nuclear Security Administration, to Newport News Nuclear BWXT-Los Alamos, LLC (N3B) under the DOE Office of Environmental Management.

Monitoring was conducted pursuant to the “Interim Facility-Wide Groundwater Monitoring Plan for the 2017 Monitoring Year, October 2016–September 2017” (2017 IFGMP) (LANL 2016, 601506) and the “Interim Facility-Wide Groundwater Monitoring Plan for the 2018 Monitoring Year, October 2017–September 2018” (2018 IFGMP) (LANL 2017, 602406), both prepared in accordance with the Compliance Order on Consent (Consent Order). The PMEs noted above included sampling of surface water, groundwater spring, and groundwater well (or well screen) locations.

This report also includes any results from previous TA-16 260 monitoring group PMEs that were unreported in their respective PMRs because validated laboratory data were not available (in some cases because of data release agreements). Any additional results from sampling that occurred outside the time frame of a PME are also included in this report.

Section IX of the Consent Order describes the role of data screening in the corrective action process. Screening values are used to identify the *potential* for unacceptable risk resulting from the presence of contaminants in groundwater and surface water. New Mexico Water Quality Control Commission (NMWQCC) groundwater standards, U.S. Environmental Protection Agency (EPA) maximum contaminant levels (MCLs), NMED screening levels for tap water, and EPA regional screening levels for tap water are used to establish a set of screening values for evaluating IFGMP monitoring data. If contaminants are present at concentrations above screening values, additional risk evaluation is required to determine the potential need for cleanup (corrective action).

This report presents the following information:

- general background information on the monitoring group
- field-measurement monitoring results
- water-quality monitoring results
- screening analysis results
- a summary based on the monitoring data and the results of screening analysis

Information on radioactive materials and radionuclides, including the results of sampling and analysis of radioactive constituents, is voluntarily provided to NMED in accordance with DOE policy.

1.1 Background

The TA-16 260 monitoring group was established for the upper Water Canyon/Cañon de Valle watershed to monitor contaminants released from Consolidated Unit 16-021(c)-99, which is the TA-16 260 Outfall (hereafter, the 260 Outfall), and other sites at TA-16. The 260 Outfall is a former high explosives- (HE-) machining outfall that discharged HE-bearing water to Cañon de Valle from 1951 through 1996 and is the predominant source of contaminants detected in groundwater in the Water Canyon/Cañon de Valle area. These discharges contaminated soils, sediments, surface waters, spring waters, and intermediate-perched and regional groundwater at TA-16.

The TA-16 260 monitoring group includes base flow, springs, alluvial groundwater monitoring wells, and groundwater monitoring wells completed in several deeper intermediate-perched groundwater zones and in the regional aquifer. Shallow monitoring locations such as the springs and alluvial wells are included in this monitoring group because they contain HE, barium, and volatile organic compound (VOC) contamination related to past activities at the 260 Outfall and other sites in the area.

TA-16 is located in the southwest corner of the Laboratory and was established to develop explosive formulations, cast and machine explosive charges, and assemble and test explosive components for the nuclear weapons program. TA-16 is bordered by Bandelier National Monument along NM 4 to the south and by the Santa Fe National Forest along NM 501 to the west. To the north and east, it is bordered by TA-08, TA-09, TA-11, TA-14, TA-15, TA-37, and TA-49. Water Canyon, which is 200 ft deep with steep walls, separates NM 4 from active sites at TA-16. Cañon de Valle forms the northern border of TA-16.

Discharges from the former 260 Outfall at Consolidated Unit 21-021(c)-99 from 1951 to 1996 served as a primary source of HE and inorganic contamination found throughout the site (LANL 1998, 059891; LANL 2003, 085531). Results of the 260 Outfall corrective measures evaluation (LANL 2007, 098734) show the drainage channel below the outfall and the canyon bottom as well as surface water, alluvial groundwater, and intermediate-perched groundwater are contaminated with explosive compounds, including RDX (hexahydro-1,3,5-trinitro-1,3,5-triazine); HMX (octahydro-1,3,5,7-tetranitro-1,3,5,7-tetrazocine); TNT (2,4,6-trinitrotoluene); and barium. In addition, the VOCs tetrachloroethene and trichloroethene have been detected in springs, alluvial groundwater, and intermediate-perched groundwater.

2.0 SCOPE OF ACTIVITIES

The PMEs for the TA-16 260 monitoring group were conducted pursuant to the 2017 IFGMP (LANL 2016, 601506) and the 2018 IFGMP (LANL 2017, 602406).

Table 2.0-1 provides the name, watershed, sample collection date, screened interval, top and bottom screen depths, casing volume, purge volume, and purge or flow rate for each of the planned monitoring locations. These locations are shown in Figure 2.0-1.

3.0 REGULATORY CRITERIA

Regulatory criteria related to groundwater water quality form the basis for the screening values to which groundwater monitoring results are compared in this PMR. These criteria include the NMWQCC groundwater standards, EPA MCLs, NMED screening levels for tap water, and EPA regional screening levels for tap water. These criteria are used to screen results in accordance with the process specified in

Section I.X of the Consent Order and are listed in Table 3.0-1. This screening process is described in more detail in section 5.2.

4.0 MONITORING RESULTS

4.1 Methods and Procedures

All methods and procedures used to perform the field activities associated with the data reported in this PMR are documented in the 2017 IFGMP (LANL 2016, 601506) and 2018 IFGMP (LANL 2017, 602406).

4.2 Field Parameter Results

Appendix A presents the field parameter measurements associated with the sampling and analysis data that are reported in this PMR.

4.3 Groundwater Elevations and Base-Flow Observations

The groundwater level is measured at each groundwater monitoring location before purging and sampling that location as required by the Consent Order. Section 4.4 notes any instances where this requirement could not be met.

In addition to collecting groundwater-level data before purging and sampling, the Laboratory has collected groundwater-level data “continuously” (e.g., hourly, daily) for most monitoring locations and these data are voluntarily presented in this PMR. Any gaps in the continuous groundwater-level records presented in this PMR are a result of one or more of the following conditions:

- Dry well
- Well not equipped with a pressure (level) transducer
- Water level below transducer
- Transducer not functioning properly (including failure)
- Transducer temporarily removed from well for maintenance and/or calibration

Groundwater-level data for the previous 2 yr are presented in Appendix B (on CD included with this document), with the exception of the manual measurements discussed below. For wells equipped with transducers, the reported water level is the water-level measurement taken earliest on the day of sampling. All manual measurements were recorded immediately before sampling. The groundwater-elevation measurements are shown graphically on Plate 1.

Base-flow measurements are shown graphically in Figure 4.3-1.

4.4 Deviations from Planned Scope

Table 4.4-1 summarizes the deviations from the planned monitoring scope that were experienced while conducting the work associated with the monitoring data reported in this PMR.

Table 4.4-2 presents a list of analytes with method detection limits (MDLs) greater than screening values. Some of the analytes were measured using more than one analytical method, leading to a range of MDLs. The tables apply to the results with the lowest MDL, so the analytical method and analytical laboratory are included in the tables for reference.

5.0 ANALYTICAL DATA RESULTS

5.1 Methods and Procedures

All methods and procedures used to perform PME analytical activities are documented in the 2017 IFGMP (LANL 2016, 601506) and the 2018 IFGMP (LANL 2017, 602406). Purge water is managed and characterized in accordance with the waste characterization strategy form associated with the well and the “Land Application of Groundwater” procedure. The “Land Application of Groundwater” procedure implements the NMED-approved decision tree for land application of drilling, development, rehabilitation, and purge water.

All sampling, data reviews, and data package validations were conducted using standard operating procedures that are part of a comprehensive quality assurance program. N3B has adopted all applicable procedures and is operating to them. Completed chain-of-custody forms serve as analytical request forms and include the requester or owner, sample number, program code, date and time of sample collection, total number of bottles, list of analytes to be measured, bottle sizes, and preservatives for each required analysis.

Data validation determines the quality of an analytical data set and focuses on specific quality assurance samples, such as matrix spikes, duplicates, surrogates, method blanks, and laboratory control samples, and holding times, which indicate the accuracy and precision of the analyses. Based on the results, data qualifiers are applied to indicate data quality issues as well as the usability of results. This process also includes a description of the reasons for any failure to meet method, procedural, or contractual requirements and an evaluation of the impact of such failure on the overall data set.

The required analytical laboratory batch quality control (QC) is defined by the analytical method, the analytical statement of work, and generally accepted industry practices. The analytical laboratory assigns qualifiers to the data to indicate the quality of the analytical results. The laboratory batch QC is used in the secondary data validation process to evaluate the quality of individual analytical results, evaluate the appropriateness of the analytical methodologies, and measure the routine performance of the analytical laboratory.

In addition to batch QC performed by analytical laboratories, in-house field QC samples are submitted to test the overall sampling and analytical laboratory process and to spot-check for analytical problems. The field QC sample results are used in secondary validation along with information provided by the analytical laboratory.

After the analytical laboratory submits data packages, the packages receive in-house secondary validation. As a result of secondary validation, a second set of qualifiers was assigned to the analytical results. Secondary validation is currently done by an automated process after the data are loaded.

Auto validation (1) ensures that the electronic data deliverable contains all the required fields, (2) verifies that results of all QC checks and procedures are within valid criteria limits, and (3) applies specific qualifiers and reason codes per the EPA’s National Functional Guidelines for data review as well as the internal data validation standard operating procedures. Once auto validation is complete, the data are uploaded into the internal database system and the public database (http://intellusnm.com/).

A detection status is assigned to the analytical result based on the analytical laboratory and secondary validation qualifiers. A detect flag of “N” indicates that, based on the qualifiers, the result was not detected.

5.2 Analytical Data

Appendix C presents the analytical data for the four PMEs reported in this PMR and from the four sampling events at these locations immediately before these PMEs. The analytical laboratory reports (including chain-of-custody forms and data validation forms) are provided in Appendix F (on CD included with this document).

Appendix C contains all data collected during the PMEs (i.e., all data that have been independently reviewed for conformance with Laboratory requirements) with the following constraints.

- All data
  - Data that are R-qualified (rejected because of noncompliance regarding QC acceptance criteria) during independent validation are considered unusable but are still reported.
  - Analytical laboratory QC results, including matrix spike and matrix spike duplicates, and field blanks, trip blanks, and equipment blanks are not included in the data set.
  - Field duplicates, reanalyses, and results from different analytical methods are reported.
  - Tracers that are used for conceptual models are not reported.
  - Water-quality data for certain constituents that are non-representative or are of questionable representativeness are flagged as watch list data and are not reported.
- Radionuclides
  - Only cesium-137, cobalt-60, neptunium-237, potassium-40, and sodium-22 are reported (or analyzed) for the gamma spectroscopy suite.
  - Americium-241 and uranium-235 are reported only by chemical separation alpha spectroscopy. No gamma spectroscopy results are presented for these analytes.
  - Other than above, all results are reported at all locations.
- Nonradionuclides
  - All detected results are reported.

Multiple analyses of a sample, including dilutions and reanalyses, create redundant results. These multiple results have the same sample ID, analytical laboratory code, and analytical method. The analytical and validation information is used to designate the preferred result, which is marked with a best value flag of “Y” (yes). The redundant values of lower quality are assigned a best value flag of “N” (no). In cases where a reanalysis gives a significantly different result than an earlier value, the original result may be rejected and assigned a best value flag of N, and the reanalysis result may be marked with a best value flag of Y. The best value flag is included in Appendix C.

No analytical data other than tracers were collected from R-25 at screen 1, screen 2, and screen 4; these tracer data are used for conceptual models and are therefore not included in the PMR.

Monitoring well R-25b is on the watch list for deep monitoring wells. Samples collected from R-25b continue to show the presence of the tracers introduced into the well in November 2015, indicating that sampling and analysis data for R-25b are not representative of surrounding groundwater chemistry; therefore, R-25b data are not included in the PMR.

Monitoring well R-63i is on the watch list for deep monitoring wells because of limited water volume; therefore, the results from R-63i are not included in the PMR.

Monitoring well CdV-R-37-2 screen 2 is on the watch list for deep monitoring wells because of reducing conditions. Water-quality and field parameter data indicate CdV-R-37-2 screen 2 does not produce representative samples, even after extended purging. In addition, elevated iron and manganese are present. Therefore, CdV-R-37-2 screen 2 data are not included in the PMR.

Monitoring data are evaluated using the screening process described below. The sources for standards and screening levels from which specific screening values are established are listed in Table 3.0-1.

- The base-flow monitoring locations are assigned to one of two screening categories—perennial or ephemeral (Table 5.2-1). Along with a hardness value, this category determines the screening values used for data at each monitoring location. Hardness-dependent screening values used to screen data at each base-flow monitoring location are determined using the geometric mean of hardness data (mg/L as calcium carbonate) collected from 2006 to 2010 at each location. Hardness-dependent acute and chronic criteria were used for total recoverable aluminum and dissolved cadmium, chromium, copper, lead, manganese, nickel, silver, and zinc in accordance with the requirements of 20 New Mexico Administrative Code (NMAC) 6.4.900.
- Groundwater data are screened in accordance to Section IX of the Consent Order. For an individual substance, the lower of the NMWQCC groundwater standard or EPA MCL is used as the screening value.
- If an NMWQCC groundwater standard or an MCL has not been established for a specific substance for which toxicological information is published, the NMED screening level for tap water is used as the groundwater screening value. The NMED screening levels are for either a cancer- or noncancer-risk type. For the cancer-risk type, the screening levels are based on a 10^{-5} excess cancer risk. This report was prepared using the March 2017 NMED screening levels for tap water.
- If an NMED screening level for tap water has not been established for a specific substance for which toxicological information is published, the EPA regional screening level for tap water is used as the groundwater screening value. The EPA screening levels are for either a cancer- or noncancer-risk type. For the cancer-risk type, the Consent Order specifies screening at a 10^{-5} excess cancer risk. The EPA screening levels for tap water are for 10^{-6} excess cancer risk, so 10 times the EPA 10^{-6} screening levels are used in the screening process. This report was prepared using the November 2017 EPA regional screening levels for tap water.
- The NMWQCC groundwater standards apply to the dissolved (filtered) portion of specified contaminants; however, the standards for mercury, organic compounds, and nonaqueous-phase liquids apply to the total unfiltered concentrations of the contaminants. EPA MCLs are applied to both filtered and unfiltered sample results.
- The analytical results for radionuclides and radioactivity are voluntarily compared with the DOE Biota Concentration Guides (BCGs) for surface water and Derived Concentration Technical Standards (DCSs) for groundwater but are not reported in Table 5.2-2 or Appendix D.

Appendix D presents each analytical result that is greater than half of its applicable screening value. Results with a best value flag of N are included in Appendix D but not discussed in the text.

Table 5.2-2 provides groundwater analytical results (by hydrogeologic zone for a specific analytical suite) that are above screening values. Multiple detections are included in the table except for field duplicate exceedances. For example, if aluminum was detected above its screening value in both a primary sample and a field duplicate, only the primary sample result is shown. If aluminum was detected above its screening value in two primary samples, both results are shown.

For the data reported in this PMR, Figures 5.2-1 through 5.2-4 show the maximum concentrations detected at all locations for the analytes that exceeded their screening values at more than one sampling location. For example, unfiltered RDX was above the NMED tap water screening level (screening value) at more than one well, so all RDX values reported in this PMR are shown in addition to the screening value exceedances, which are displayed in yellow boxes.

Graphs in Appendix E display analyte concentration histories for monitoring group locations where the analyte was above its screening value at least once in the following expanded data set: data reported in this PMR plus data for the three previous TA-16 260 monitoring group PMEs. Appendix E may include instances where the analyte data reported in this PMR are evaluated using a higher screening value than the screening value that was used to evaluate previously reported analyte data. For example, the current screening value for perchlorate, 13.8 µg/L per 2016 Consent Order data screening requirements, is greater than the former perchlorate screening value of 4 µg/L, which was used to evaluate previously reported analyte data. The horizontal solid red line on each graph depicts the current analyte screening value, except in cases where there were no exceedances of the current screening value by the data reported in this PMR but there was at least one exceedance of the former (lower) screening value by the previously reported analytical data. In such cases, the horizontal solid red line depicts the former (lower) screening value. Results with a best value flag of N are not included in Appendix E.

5.2.1 Surface Water (Base Flow)

Table 5.2-2 shows that four surface-water analytical results reported in this PMR were above applicable screening values. These four screening value exceedances were for unfiltered aluminum.

Between E252 and Water at Beta

For the June 7, 2017, and February 8, 2018, sampling events at location Between E252 and Water at Beta, unfiltered aluminum was detected at 614 µg/L and 1420 µg/L, respectively. These concentrations were above the hardness-based NMWQCC aquatic life standard for chronic exposure (screening value) of 530 µg/L (based on 50 mg/L hardness). The range of previous unfiltered aluminum concentrations detected at Between E252 and Water at Beta since June 2007 is 139 µg/L to 3340 µg/L.

Pajarito below S&N Ancho E Basin Confluence

For the June 1, 2017, and February 13, 2018, sampling events at location Pajarito below S&N Ancho E Basin Confluence, unfiltered aluminum was detected at 1470 µg/L and 1540 µg/L, respectively. These concentrations were above the hardness-based NMWQCC aquatic life standard for chronic exposure (screening value) of 530 µg/L (based on 50 mg/L hardness). The range of previous unfiltered aluminum concentrations detected at Pajarito below S&N Ancho E Basin Confluence since June 2007 is 165 µg/L to 11,100 µg/L.

5.2.2 Groundwater

Table 5.2-2 shows that 56 groundwater analytical results reported in this PMR were above applicable screening values. These 56 screening value exceedances were for the following 5 analytes: barium (filtered), boron (filtered), iron (filtered), manganese (filtered), and RDX (unfiltered).

Groundwater Springs

Bulldog Spring

For the February 21, 2018, sampling event at Bulldog Spring, RDX was detected at 7.69 µg/L. This concentration was above the NMED tap water screening level (screening value) of 7.02 µg/L. The range of previous RDX concentrations detected at Bulldog Spring since July 2007 is 1.68 µg/L to 6.88 µg/L.

Burning Ground Spring

For the June 9, 2017; September 1, 2017; and February 10, 2018, sampling events at Burning Ground Spring, RDX was detected at 7.5 µg/L, 12 µg/L, and 15 µg/L, respectively. These concentrations were above the NMED tap water screening level (screening value) of 7.02 µg/L. The range of previous RDX concentrations detected at Burning Ground Spring since October 2007 is 7.88 µg/L to 51.1 µg/L.

Martin Spring

For the June 1, 2017; August 29, 2017; and February 10, 2018, sampling events at Martin Spring, boron was detected at 918 µg/L, 934 µg/L, and 984 µg/L, respectively, and RDX was detected at 74 µg/L, 61.1 µg/L, and 80.4 µg/L, respectively. These concentrations were above the NMWQCC groundwater standard (screening value) of 750 µg/L for boron and the NMED tap water screening level (screening value) of 7.02 µg/L for RDX.

The range of boron concentrations detected at Martin Spring since October 2007 is 647 µg/L to 1440 µg/L. The range of RDX concentrations detected at Martin Spring October 2007 since is 27.7 µg/L to 143 µg/L.

Sanitary Wastewater Systems Consolidation (SWSC) Spring

For the June 9, 2017, sampling event at SWSC Spring, RDX was detected at 12.7 µg/L. This concentration was above the NMED tap water screening level (screening value) of 7.02 µg/L. The range of RDX concentrations detected at SWSC Spring since October 2007 is 21.7 µg/L to 61 µg/L.

Alluvial Monitoring Wells

CdV-16-02656

For the June 2, 2017; September 14, 2017; and February 10, 2018, sampling events at CdV-16-02656, barium was detected at 1840 µg/L, 1850 µg/L, and 1520 µg/L, respectively. These concentrations were above the NMWQCC groundwater standard (screening value) of 1000 µg/L. The range of barium concentrations detected at CdV-16-02656 since October 2007 is 1960 µg/L to 4890 µg/L.

CdV-16-02659

For the June 15, 2017, and September 14, 2017, sampling events at CdV-16-02659, barium was detected at 4750 µg/L and 4940 µg/L and RDX at 10.7 µg/L and 7.21 µg/L, respectively. These concentrations were above the NMWQCC groundwater standard (screening value) of 1000 µg/L for barium and the NMED tap water screening level (screening value) of 7.02 µg/L for RDX. For the February 10, 2018, sampling event, barium was detected at 4010 µg/L. This concentration was above the screening value for barium.

The range of barium concentrations detected at CdV-16-02659 since October 2007 is 3130 µg/L to 13,600 µg/L. The range of RDX concentrations detected at CdV-16-02659 since October 2007 is 2.51 µg/L to 28.6 µg/L.

CdV-16-611923

For the June 6, 2017, sampling event at CdV-16-611923, barium and manganese were detected at concentrations of 6810 µg/L and 238 µg/L, respectively. These concentrations were above the NMWQCC groundwater standards (screening values) of 1000 µg/L for barium and 200 µg/L for manganese. For the February 16, 2018, sampling event, barium was detected at 5050 µg/L. This concentration was above the screening value for barium.

The ranges of previous barium and manganese concentrations detected at CdV-16-611923 since April 2010 are 7070 µg/L to 49,400 µg/L and 111 µg/L to 7510 µg/L, respectively.

CdV-16-611937

For the June 6, 2017, sampling event at CdV-16-611937, manganese was detected at 1030 µg/L. This concentration was above the NMWQCC groundwater standard (screening value) of 200 µg/L. For the September 12, 2017, and February 16, 2018, sampling events at CDV-16-611937, barium was detected at 2390 µg/L and 1340 µg/L; iron at 4690 µg/L and 11,700 µg/L; and manganese at 1850 µg/L and 1880 µg/L, respectively. These concentrations were above the NMWQCC groundwater standards (screening values) of 1000 µg/L, 1000 µg/L, and 200 µg/L for barium, iron, and manganese, respectively.

The ranges of previous barium, iron, and manganese concentrations detected at CdV-16-611937 since April 2010 are 534 µg/L to 13,500 µg/L; 585 µg/L to 12,500 µg/L; and 609 µg/L to 3880 µg/L, respectively.

Permeable Reactive Barrier (PRB) Alluvial Seep (16-61439)

For the June 12, 2017, and February 16, 2018, sampling events at the PRB Alluvial Seep (16-61439), barium was detected at 3390 µg/L and 2960 µg/L and RDX was detected at 13.1 µg/L and 10.5 µg/L, respectively. These concentrations were above the NMWQCC groundwater standard (screening value) of 1000 µg/L for barium and the NMED tap water screening level (screening value) of 7.02 µg/L for RDX. For the September 15, 2017, sampling event, barium was detected at 3730 µg/L. This concentration was above the screening value for barium.

The ranges of previous barium and RDX concentrations detected at the PRB Alluvial Seep (16-61439) since December 2016 are 3340 µg/L to 4170 µg/L and 7.24 µg/L to 11.5 µg/L, respectively.

Intermediate Monitoring Wells

CdV-9-1(i) S1

For the May 31, 2017; August 30, 2017; December 19, 2017; and February 6, 2018, sampling events at CdV-9-1(i) S1, RDX was detected at 20.8 µg/L, 20 µg/L, 17.6 µg/L, and 17.6 µg/L, respectively. These concentrations were above the NMED tap water screening level (screening value) of 7.02 µg/L. The range of RDX concentrations detected at well CdV-9-1(i) S1 since May 2015 is 14.7 µg/L to 37.3 µg/L.

CdV-16-1(i)

For the June 12, 2017; September 15, 2017; December 8, 2017; and February 16, 2018, sampling events at CdV-16-1(i), RDX was detected at 37.4 µg/L, 27.5 µg/L, 28 µg/L, and 31.4 µg/L, respectively. These concentrations were above the NMED tap water screening level (screening value) of 7.02 µg/L. The range of RDX concentrations detected at well CdV-16-1(i) since October 2007 is 22.2 µg/L to 32.4 µg/L.

CdV-16-2(i)r

For the June 6, 2017; August 29, 2017; December 5, 2017; and February 16, 2018, sampling events at CdV-16-2(i)r, RDX was detected at 99.3 µg/L, 99.1 µg/L, 126 µg/L, and 98.1 µg/L, respectively. These concentrations were above the NMED tap water screening level (screening value) of 7.02 µg/L. The range of RDX concentrations detected at well CdV-16-2(i)r since October 2007 is 51.2 µg/L to 128 µg/L.

CdV-16-4ip S1

For the June 6, 2017; August 29, 2017; December 5, 2017; and February 16, 2018, sampling events at CdV-16-4ip S1, RDX was detected at 113 µg/L, 134 µg/L, 177 µg/L, and 138 µg/L, respectively. These concentrations were above the NMED tap water screening level (screening value) of 7.02 µg/L. The range of RDX concentrations detected at well CdV-16-4ip S1 since August 2010 is 111 µg/L to 265 µg/L.

Regional Monitoring Wells

R-68

For the June 2, 2017; July 13, 2017; September 6, 2017; December 11, 2017; and February 6, 2018, sampling events at R-68, RDX was detected at 8.08 µg/L, 10.2 µg/L, 17.1 µg/L, 13.7 µg/L, and 16 µg/L, respectively. These concentrations were above the NMED tap water screening level (screening value) of 7.02 µg/L for RDX.

The only other previous RDX result for R-68 was 8.82 µg/L in March 2017.

5.3 Sampling Program Modifications

No modifications to the periodic monitoring sampling for the TA-16 260 monitoring group are proposed at this time.

6.0 SUMMARY AND INTERPRETATIONS

6.1 Monitoring Results

Appendix A presents the field parameter measurements associated with the sampling and analysis data that are reported in this PMR.

6.2 Analytical Results

6.2.1 Surface Water (Base Flow)

Four surface water analytical results reported in this PMR were above applicable screening values (Table 5.2-2). For results above screening values, the types of contaminants detected and their concentrations are consistent with data reported in previous PMRs for this monitoring group.

6.2.2 Groundwater

A total of 56 groundwater analytical results reported in this PMR were above applicable screening values (Table 5.2-2). For results above screening values, the types of contaminants detected and their concentrations are consistent with data reported in previous PMRs for this monitoring group, with the following exceptions.

Groundwater Springs

The unfiltered RDX result reported in this PMR for Bulldog Spring (7.69 µg/L) is the new maximum value and the first result exceeding the screening value.

The unfiltered RDX result reported in this PMR for SWSC Spring (12.7 µg/L) is the new minimum value.

Alluvial Monitoring Wells

The filtered barium results reported in this PMR for CdV-16-02656 (1840 µg/L, 1850 µg/L, and 1520 µg/L) are all below the previous minimum concentration (1960 µg/L) and the result from February 10, 2018, (1520 µg/L) is the lowest observed to date.

The filtered barium results reported in this PMR for CdV-16-611923 (6810 µg/L and 5050 µg/L) are both below the previous minimum concentration (7070 µg/L) and the result from February 16, 2018, (5050 µg/L) is the lowest observed to date.

The filtered barium concentration (2960 µg/L) detected at the PRB Alluvial Seep (16-61439) on February 16, 2018, is the lowest observed to date. The unfiltered RDX concentration (13.1 µg/L) detected on June 12, 2017, is the highest observed to date.

Intermediate Monitoring Wells

The unfiltered RDX concentration (37.4 µg/L) detected at CdV-16-1(i) on June 12, 2017, is the highest observed to date.

Regional Monitoring Wells

The unfiltered RDX results reported in this PMR for R-68 for July 13, 2017; September 6, 2017; December 11, 2017; and February 6, 2018, (10.2 µg/L, 17.1 µg/L, 13.7 µg/L, and 16 µg/L, respectively) are all above the only previous result for this location (8.82 µg/L) and the result from September 6, 2017, (17.1 µg/L) is the highest observed to date.

6.4 Data Gaps

Table 4.4-1 summarizes the deviations from the planned monitoring scope that were experienced while conducting the work associated with the monitoring data reported in this PMR.

6.4 Remediation System Monitoring

Remediation system monitoring is not applicable to the TA-16 260 monitoring group because no systems are installed in the monitoring group area.

7.0 REFERENCES

The following reference list includes documents cited in this report. Parenthetical information following each reference provides the author(s), publication date, and ERID, ESHID, or EMID. This information is also included in text citations. ERIDs were assigned by the Laboratory's Associate Directorate for Environmental Management (IDs through 599999); ESHIDs were assigned by the Laboratory's Associate Directorate for Environment, Safety, and Health (IDs 600000 through 699999); and EMIDs are assigned by N3B (IDs 700000 and above). IDs are used to locate documents in N3B's Records Management System and in the Master Reference Set. The NMED Hazardous Waste Bureau and N3B maintain copies

of the Master Reference Set. The set ensures that NMED has the references to review documents. The set is updated when new references are cited in documents.

[a] gpm = Gallons per minute.

[b] n/a = Not applicable.

[c] Purge rate was not constant and the range of purge rates is reported.

[d] NC = Not collected. R-26 PZ-2 is a piezometer well that must be manually bailed to purge and sample; therefore, a purge flow rate does not exist.

[e] RDX Project sample.

[a] UF = Unfiltered.1

[b] NMWQCC Aquatic Life Standards Chronic = New Mexico Water Quality Control Commission aquatic life standards for chronic exposure.

[c] NMED A1 TAP SCRN LVL = New Mexico Environment Department screening level for tap water.

[d] F = Filtered.

[e] NMWQCC GW STD = New Mexico Water Quality Control Commission groundwater standard.

[a] — = Not applicable.

[b] WG = Groundwater.

[c] mg/L = Milligrams per liter.

[d] gpm = Gallons per minute.

[e] mV = Millivolts.

[f] SU = Standard unit.

[g] µS/cm – Microsiemens per centimeter.

[h] deg C = Degrees Celsius.

[i] NTU = Nephelometric turbidity unit.

[j] WS = Base flow surface water.

Appendix B

Groundwater-Elevation Measurements
(on CD included with this document)

Appendix C

Analytical Chemistry Results, Including Results from Previous Four Monitoring Events if Available

The following pages provide lists of (1) acronyms, abbreviations, symbols, and various analytical codes; (2) analytical laboratory qualifier codes; and (3) secondary validation flag codes that may be used in Appendix C. Please note that these are comprehensive lists, and this periodic monitoring report may not include all of the terms in the lists.

Acronyms and Abbreviations

Acronym, Abbreviation, or Symbol	Description
Miscellaneous	
%	percent
%D	percent difference
%R	percent recovery
%RSD	percent relative standard deviation
<	Based on qualifiers, the result was a nondetection.
—	none
4,4'-DDD	4,4'-dichlorodiphenyldichloroethane
4,4'-DDT	4,4'-dichlorodiphenyltrichloroethane
BHC	benzene hexachloride
CB	chlorinated biphenyl
CCB	continuing calibration blank
CCV	continuing calibration verification
CLP	Contract Laboratory Program
CRDL	contract-required detection limit
CRI	CDRL check standard
DCG	Derived Concentration Guide (DOE)
DDE	dichlorodiphenyldichloroethylene
DNX	dinitroso-RDX (or hexahydro-1,3-dinitroso-5-nitro-1,3,5-triazine)
DOE	Department of Energy (U.S.)
DQO	data quality objective
EPA	Environmental Protection Agency (U.S.)
GC	gas chromatography
GC/MS	gas chromatography/mass spectrometry
GELC	General Engineering Laboratories, Inc. (used in Environmental Information Management database)
GFAA	graphite furnace atomic absorption
GFPC	gas-flow proportional counter
GW	groundwater
HH OO	Human Health—Organism Only (NMWQCC standard)
HMX	1,3,5,7-tetranitro-1,3,5,7-tetrazocine
HPLC	high-pressure liquid chromatography
ICAL	initial calibration
ICPAES	inductively coupled plasma atomic (optical) emission spectroscopy
ICV	initial calibration verification

Acronyms and Abbreviations (continued)

Acronym, Abbreviation, or Symbol	Description
Miscellaneous (continued)	
IDL	instrument detection limit
IS	internal standard
LAL	lower acceptance limit
LANL	Los Alamos National Laboratory
LCS	laboratory control sample
LLEE	low-level electrolytic extraction
LOC	level of chlorination
LSC	liquid scintillation counting
Lvl	level
MCL	maximum contaminant level (EPA)
MDA	minimum detectable activity
MDC	minimum detectable concentration
MDL	method detection limit
MNX	mononitroso-RDX (or hexahydro-1-nitroso-3,5-dinitro-1,3,5-triazine)
MS	matrix spike
MSD	matrix spike duplicate
NM	New Mexico
NMED	New Mexico Environment Department
NMWQCC	New Mexico Water Quality Control Commission
OPR	ongoing precision recovery
PCB	polychlorinated biphenyl
PCDD	polychlorinated dibenzo-p-dioxin
PCDF	polychlorinated dibenzofuran
PQL	practical quantitation limit
Prelim	preliminary
QC	quality control
RDX	hexahydro-1,3,5-trinitro-1,3,5-triazine
RF	response factor
RL	reporting limit
RPD	relative percent difference
RRF	relative response factor
RRT	relative retention time
RT	retention time
Scr	screening
SDG	sample delivery group
SMO	Sample Management Office
SSC	suspended sediment concentration
SU	standard unit

Acronyms and Abbreviations (continued)

Acronym, Abbreviation, or Symbol	Description
Miscellaneous (continued)	
TCDD	tetrachlorodibenzo-p-dioxin
TCDF	tetrachlorodibenzofuran
TDS	total dissolved solids
TPH-DRO	total petroleum hydrocarbons—diesel range organics
TNX	trinitroso-RDX (or hexahydro-1,3,5-trinitroso-1,3,5-triazine)
TPU	total propagated uncertainty
UAL	upper acceptance limit
Field Matrix Codes	
W	water
WG	groundwater
WM	snowmelt
WP	persistent flow
WS	base flow
WT	storm runoff
Field Prep Codes	
F	filtered
UF	unfiltered
Lab Sample Type Codes	
CS	client sample
DL	dilution
DUP	duplicate
INIT	initial
RE	reanalysis
REDL	reanalysis dilution
REDP	reanalysis duplicate
RI	reissue
TRP	triplicate
Field QC Type Codes	
EQB	equipment rinsate blank
FB	field blank
FD	field duplicate
FR	field rinsate
FS	field split
FTB	field trip blank
FTR	field triplicate
INB	equipment blank taken during installation and not associated with a sampling event
ITB	trip blank taken during installation and not associated with a sampling event
NA	not applicable

Acronyms and Abbreviations (continued)

Acronym, Abbreviation, or Symbol	Description
Field QC Type Codes (continued)	
PEB	performance evaluation blank
PEK	performance evaluation known
REG	regular
RES	resample
SS	special sampling event, data unique
SS-EQB	equipment blank of special sampling event, data unique
SS-FB	field blank of special sampling event, data unique
SS-FD	field duplicate of special sampling event, data unique
SS-FTB	field trip blank of special sampling event, data unique
Analytical Suite Codes	
DIOX/FUR, Diox/Fur	dioxins and furans
DRO	diesel range organics
Geninorg, GENINORG, General Chemistry	general inorganics
GRO	gasoline range organics
HERB	herbicides
HEXP	high explosives
INORGANIC	inorganics
ISOTOPE, Isotope	isotope ratios
LCMS/MS	liquid chromatography mass spectrometry/mass spectrometry
METALS, Metals	metals
PEST/PCB, PESTPCB	pesticides and PCBs
RAD, Rad	radiochemistry
SVOC, SVOA	semivolatile organic compounds
VOC, VOA	volatile organic compounds
Detect Flag and Best Value Flag Codes	
N	no
Y	yes
Lab Codes	
ALTC	Alta Analytical Laboratory, Inc., San Diego, CA
ARSL	American Radiation Services, Inc.
CFA	Cape Fear Analytical, LLC, Wilmington, NC
C-INC	Isotope and Nuclear Chemistry Division (LANL)
COAST	Coastal Science Laboratories, Austin, TX
CST	Chemical Sciences and Technology Division (LANL)
EES6	Hydrology, Geochemistry, and Geology Group (LANL)
ESE	Environmental Sciences & Engineering, Inc., Gainesville, FL
FLD	measurement taken in field

Acronyms and Abbreviations (continued)

Acronym, Abbreviation, or Symbol	Description
Lab Codes (continued)	
GELC	General Engineering Laboratories, Inc., Charleston, SC (used in Environmental Information Management data base)
GEO	Geochron Laboratories, Boston, MA
HENV	Health and Environmental Laboratory (Johnson Controls, Northern New Mexico)
HUFFMAN	Huffman Laboratories, Inc., Golden, CO
KA	KEMRON Environmental Services, Inc., Vienna, VA
LVLI	Lionville Laboratory, Inc., Philadelphia, PA
PARA	Paragon Analytics, Inc., Salt Lake City, UT
PEC	Pacific Ecorisk Laboratories, Fairfield, CA
QESL	Quanterra Environmental Services, St. Louis, MO
QST	QST Environmental, Newberry, FL
RECRAP	RECRA Labnet, Lionville, PA
RFWC	Roy F. Weston, Inc., West Chester, PA
SGSW	Paradigm Analytical Laboratories, Inc., Wilmington, NC
SILENS	Stable Isotope Laboratory, Woods Hole, MA
STL2, STR	Severn Trent Laboratories, Inc., Richland, WA (historical)
STLA	Severn Trent Laboratories, Inc., Los Angeles, CA
STSL	Severn Trent Laboratories, Inc., St. Louis, MO
SwRI	Southwest Research Institute, San Antonio, TX
UAZ	University of Arizona, Tucson
UIL	University of Illinois, Urbana-Champaign
UMTL	University of Miami Tritium Lab

Note: A combination of analytical laboratory qualifier codes means that several codes apply.

Analytical Laboratory Qualifier Codes

Code	Description
*	(Inorganic)—Duplicate analysis (relative percent difference [RPD]) not within control limits.
B	(Organic)—Analyte was present in the blank and the sample. (Inorganic) —Reported value was obtained from a reading that was less than the contract-required detection limit (CRDL) but greater than or equal to the instrument detection limit (IDL).
BJ	See B code and see J code.
BJP	See B code, see J code, and see P code.
BPX	(B) (Organic)—This analyte was detected in the associated laboratory method blank and the sample. (B) (Inorganic)—The result for this analyte was greater than the IDL but less than the CRDL. (P) (Pesticides/PCBs)—The quantitative results for this analyte between the primary and secondary gas chromatography (GC) columns were greater than 25% difference. (P) (SW-846 EPA Method 8310, High-Pressure Liquid Chromatography, [HPLC] Results)—The quantitative results for this analyte between the primary and secondary HPLC columns or primary and secondary HPLC detectors were greater than 40% difference. (X) (Organic/Inorganic)—The result for this analyte should be regarded as not detected.
D	The result for this analyte was reported from a dilution.
DJ	See D code and see J code.
DNA	Did not analyze because equipment was broken.
E	(Organic) Analyte exceeded the concentration range. (Inorganic) The serial dilution was exceeded.
E*	See E code and see * code.
EJ	See E code and see J code.
EJ*	See E code, see J code, and see * code.
EJN	(E) (Organic)—The result for this analyte exceeded the upper range of the instrument initial calibration curve. (E) (Inorganic) (inductively coupled plasma atomic [optical] emission spectroscopy [ICPAES])—The result for this analyte in the serial dilution analysis was outside acceptance criteria. (E) (Inorganic) (graphite furnace atomic absorption [GFAA])—The result for this analyte failed one or more Control Laboratory Program (CLP) acceptance criteria as explained in the case narrative. (J) (Organic/General Inorganics)—The result for this analyte was greater than the method detection limit (MDL) but less than the practical quantitation limit (PQL). (N) (Organic)—The reported analyte is a tentatively identified compound (TIC). (N) (Inorganic)—The result for this analyte in the matrix spike (MS) sample was outside acceptance criteria.
EN	See E code and see N code.
EN*	(E) (Organic)—The result for this analyte exceeded the upper range of the instrument initial calibration curve. (E) (Inorganic) (ICPAES)—The result for this analyte in the serial dilution analysis was outside acceptance criteria. (E) (Inorganic) (GFAA)—The result for this analyte failed one or more CLP acceptance criteria as explained in the case narrative. (N) (Organic)—The reported analyte is a TIC. (N) (Inorganic)—The result for this analyte in the MS sample was outside acceptance criteria. * (Inorganic)—The result for this analyte in the laboratory replicate analysis was outside acceptance criteria.
H	(Organic/Inorganic)—The required extraction or analysis holding time for this result was exceeded.

Analytical Laboratory Qualifier Codes (continued)

Code	Description
H*	(H) (Organic/Inorganic)—The required extraction or analysis holding time for this result was exceeded. * (Organic) and (Inorganic)—The result for this analyte in the laboratory control sample analysis was outside acceptance criteria.
HJ	See H code and see J code.
HJ*	(H) (Organic/Inorganic)—The required extraction or analysis holding time for this result was exceeded. (J) (Organic/General Inorganics)—The result for this analyte was greater than the MDL but less than the PQL. * (Inorganic)—The result for this analyte in the laboratory replicate analysis was outside acceptance criteria.
INS	(d15N)—The d15N of nitrate is a signature of the nitrate present in a sample. Therefore, nitrate has to be present to have a signature. A d15N value cannot be given to a blank because the blank does not have nitrate. This is different from most analytical methods, where a blank is run with the designator “nondetect” or “detected, but below detection limit.”
J	(Inorganic)—The associated numerical value is an estimated quantity. (Organic)—The associated numerical value is an estimated quantity.
J*	See J code and see * code.
JB	See J code and see B code
JN	See J code and see N code.
JN*	See J code, see N code, and see * code.
JP	See J code and see P code.
N	(Inorganic)—Spiked sample recovery was not within control limits.
N*	See N code and see * code.
N*E	See N code, see * code, and see E code.
NE	See N code and see E code.
P	Percent difference between the results on the two columns during the analysis differed by more than 40%.
PJ	See P code and see J code.
Q	One or more quality control criteria have not been met. Refer to the applicable narrative or data exception report.
U	The material was analyzed for but was not detected above the level of the associated numeric value.
U*	See U code and see * code.
UD	See U code and see D code.
UE	See U code and see E code.
UE*	See U code, see E code, and see * code.
UEN	See U code, see E code, and see N code.
UH	See U code and see H code.

Analytical Laboratory Qualifier Codes (continued)

Code	Description
UH*	(U) (Organic/Inorganic)—The result for this analyte was not detected at the specified reporting limit. (H) (Organic/Inorganic)—The required extraction or analysis holding time for this result was exceeded. * (Inorganic)—The result for this analyte in the laboratory replicate analysis was outside acceptance criteria.
UI	(Rad) Gamma spectroscopy result should be regarded as an uncertain identification.
UN	EPA flag (Inorganic)—Compound was analyzed for but was not detected. Spiked sample recovery was not within control limits.
UN*	EPA flag (Inorganic)—See U code, see N code, and see * code.
UUI	(Rad) Gamma spectroscopy result should be regarded as an uncertain identification, and the analytical lab assigned these gamma spectroscopy results as not detected.
X	The analytical laboratory suspects the result is a nondetect despite positive quantification results.

Secondary Validation Flag Codes

Code	Description
A	The contractually required supporting documentation for this datum is absent.
I	The calculated sums are considered incomplete because of the lack of one or more congener results.
J	The analyte is classified as detected, but the reported concentration value is expected to be more uncertain than usual.
J-	The analyte is classified as detected, but the reported concentration value is expected to be more uncertain than usual with a potential negative bias.
J+	The analyte is classified as detected, but the reported concentration value is expected to be more uncertain than usual with a potential positive bias.
JN-	Presumptive evidence of the presence of the material is at an estimated quantity with a suspected negative bias.
JN+	Presumptive evidence of the presence of the material is at an estimated quantity with a suspected positive bias.
N	There is presumptive evidence of the presence of the material.
NJ	(Organic) Analyte has been tentatively identified, and the associated numerical value is estimated based upon a 1:1 response factor to the nearest eluting internal standard.
NQ	No validation qualifier flag is associated with this result, and the analyte is classified as detected.
PM	Manual review of raw data is recommended to determine if the observed noncompliances with quality acceptance criteria adversely impact data use.
R	The reported sample result is classified as rejected because of serious noncompliances regarding quality control (QC) acceptance criteria. The presence or absence of the analyte cannot be verified based on routine validation alone.
U	The analyte is classified as not detected.
UJ	The analyte is classified as not detected, with an expectation that the reported result is more uncertain than usual.

[a] F = Filtered.

[b] INIT = Initial.

[c] REG = Regular.

[d] Y = Yes.

[e] NQ = Not qualified.

[f] GELC = GEL Laboratories, LLC, Division of the GEL Group, Charleston, SC.

[g] NM Groundwater Standard = New Mexico Water Quality Control Commission groundwater standard.

[h] J- = The analyte is classified as detected, but the reported concentration value is expected to be more uncertain than usual with a potential negative bias.

[i] I6a = The associated matrix spike recovery was below the lower acceptance limit but >10%. Follow the external laboratory limits located within the associated data package.

[j] LCMS/MS = Liquid chromatography mass spectrometry/mass spectrometry.

[k] UF = Unfiltered.

[l] DL = Dilution.

[m] J+ = The analyte is classified as detected, but the reported concentration value is expected to be more uncertain than usual with a potential positive bias.

[n] I6b = The associated matrix spike recovery was above the upper acceptance limit. Follow the external laboratory limits located within the associated data package.

[o] NM Aqu Acute = New Mexico Water Quality Control Commission aquatic life standards acute.

Appendix E

Analytical Chemistry Graphs of Screening-Value Exceedances

Note: The depths in the concentration plots are screen top depths (see Table 2.0-1).
