DEPARTMENT OF ENERGY
Environmental Management Los Alamos Field Office (EM-LA)
Los Alamos, New Mexico 87544

November 30, 2021

EMLA-2022-BF004-02-001

Mr. Rick Shean
Bureau Chief
Hazardous Waste Bureau
New Mexico Environment Department
2905 Rodeo Park Drive East, Building 1
Santa Fe, NM 87505-6313

Subject: Submittal of the 2021 Annual Periodic Monitoring Reports for the General Surveillance Monitoring Group and Base Flow Sampling

Dear Mr. Shean:

Enclosed please find two hard copies each with electronic files of the "2021 Annual Periodic Monitoring Report for the General Surveillance Monitoring Group: Los Alamos and Pueblo Canyon, Mortandad and Sandia Canyon, Water Canyon/Cañon de Valle, Ancho Canyon, White Rock Canyon, and Pajarito Canyon Watersheds" and the "2021 Annual Periodic Monitoring Report for Base Flow Sampling: Los Alamos Canyon, Sandia Canyon, Water Canyon, White Rock Canyon, and Pajarito Canyon Watersheds."

The General Surveillance monitoring group periodic monitoring report (PMR) includes results from sampling campaigns performed during the fourth quarter of monitoring year (MY) 2020 through the third quarter of MY 2021.

The Base Flow sampling PMR includes results from White Rock Canyon General Surveillance sampling campaigns performed during the first and third quarters of MY 2021 and for Technical Area 16 260 base flow locations performed during the fourth quarter of MY 2020 and the second quarter of MY 2021. In addition to results from the current periodic monitoring events (PMEs), results are reported for the previous four PMEs as well as base flow data that have not yet been reported because the validated laboratory data were not available at the time of the previous publications.

These reports are submitted in accordance with Appendix E, Section IV, of the June 2016 Compliance Order on Consent, as modified on February 27, 2017.

If you have any questions, please contact Steve Veenis at (505) 309-1362 (steve.veenis@em-la.doe.gov) or Hai Shen at (505) 709-7600 (hai.shen@em.doe.gov).

Sincerely,

ARTURO DURAN

2021 Annual Periodic Monitoring Report for the General Surveillance Monitoring Group: Los Alamos and Pueblo Canyon, Mortandad and Sandia Canyon, Water Canyon/ Cañon de Valle, Ancho Canyon, White Rock Canyon, and Pajarito Canyon Watersheds

N3B Los Alamos

Newport News Nuclear BWXT-Los Alamos, LLC (N3B), under the U.S. Department of Energy Office of Environmental Management Contract No. 89303318CEM000007 (the Los Alamos Legacy Cleanup Contract), has prepared this document pursuant to the Compliance Order on Consent, signed June 24, 2016. The Compliance Order on Consent contains requirements for the investigation and cleanup, including corrective action, of contamination at Los Alamos National Laboratory. The U.S. government has rights to use, reproduce, and distribute this document. The public may copy and use this document without charge, provided that this notice and any statement of authorship are reproduced on all copies.

EXECUTIVE SUMMARY

This annual periodic monitoring report (PMR) presents the Newport News Nuclear BWXT-Los Alamos, LLC, groundwater monitoring program results for the General Surveillance monitoring group that have not been previously reported. All monitoring work reported in this PMR was conducted pursuant to the "Interim Facility-Wide Groundwater Monitoring Plan for the 2020 Monitoring Year, October 2019–September 2020" (2020 IFGMP) and the "Interim Facility-Wide Groundwater Monitoring Plan for the 2021 Monitoring Year, October 2020–September 2021, Revision 1" (2021 IFGMP), both prepared in accordance with the 2016 Compliance Order on Consent (Consent Order).

All active monitoring locations in the General Surveillance monitoring group are located within the Los Alamos and Pueblo Canyon, Mortandad and Sandia Canyon, Water Canyon/Cañon de Valle, Ancho Canyon, White Rock Canyon, and Pajarito Canyon watersheds. The General Surveillance monitoring group includes the monitoring of base flows; springs; and alluvial, perched-intermediate, and regional well and well screen locations. General Surveillance monitoring group base flow locations are reported within the 2021 annual base flow PMR.

This PMR presents monitoring results for 16 periodic monitoring events (PMEs) conducted during the fourth quarter of monitoring year (MY) 2020 and the first, second, and third quarters of MY 2021. Of the 16 PMEs reported in this PMR, 2 were conducted in the Los Alamos and Pueblo Canyon watersheds, 3 in the Mortandad and Sandia Canyon watersheds, 2 in the Water Canyon/Cañon de Valle watershed, 4 in the Ancho Canyon watershed, 1 in the White Rock Canyon watershed, and 4 in the Pajarito Canyon watershed.

The third quarter of MY 2020 was affected by the COVID-19 pandemic. The U.S. Department of Energy Environmental Management Los Alamos Field Office (EM-LA) transitioned to essential mission critical activities (EMCA) status on March 24, 2020. As described in a March 31, 2020, letter from EM-LA to the New Mexico Environment Department Hazardous Waste Bureau, fieldwork was limited to only the activities necessary to ensure the safety of the public, the workers, and the environment. Samples scheduled to be collected in the third quarter of MY 2020 were canceled because of EMCA status. Phased resumption of operations at Los Alamos National Laboratory began on June 8, 2020. Samples for the Los Alamos and Pueblo Canyon and Pajarito Canyon watersheds were collected in the fourth quarter of MY 2020 and are included in this PMR. In addition, a reduced number of locations, limited to those accessible by vehicle or short hike, were sampled during the MY 2021 Quarter 1 White Rock sampling campaign in order to maintain COVID-19 safe protocols.

In addition to results from the current PMEs, results are reported for the previous four PMEs as well as earlier General Surveillance monitoring group PMEs that have not yet been reported because the validated laboratory data were not available at the time of the previous General Surveillance PMR publications.

Groundwater samples collected during the PMEs were analyzed for all or some of the following analytical groups, as specified in the 2020 and 2021 IFGMPs: metals; volatile organic compounds; semivolatile organic compounds; low-level 1,4-dioxane; low-level nitrosamines; per- and polyfluoroalkyl substances; polychlorinated biphenyls; high explosives; dioxins and furans; radionuclides (including low-level tritium); and general inorganic chemicals (including perchlorate). The same samples were also analyzed for the following field parameters: dissolved oxygen, flow rate (in gallons per minute), oxygen-reduction potential, pH, specific conductance, temperature, and turbidity.

In this PMR, 20 groundwater analytical results were above applicable screening values, which includes 6 exceedances from the fourth quarter of MY 2020 that were not reported in the previous PMR.

Ancho Canyon	2020	4	Not sampled[c]	—
	2021	1	12/16/2020	12/18/2020
		2	02/19/2021	02/19/2021
		3	06/02/2021	06/04/2021

[a] Site was not sampled because it was dry.

[b] — = Not applicable.

[c] Site was not sampled because of mechanical issues.

The annual General Surveillance monitoring group PMR is submitted to the New Mexico Environment Department (NMED) every November. This PMR includes results from the General Surveillance monitoring group PMEs performed during the fourth quarter of monitoring year (MY) 2020 and the first, second, and third quarters of MY 2021.

The third quarter of MY 2020 was affected by the COVID-19 pandemic. The U.S. Department of Energy Environmental Management Los Alamos Field Office (EM-LA) transitioned to essential mission critical activities (EMCA) status on March 24, 2020. As described in a March 31, 2020, letter from EM-LA to the New Mexico Environment Department Hazardous Waste Bureau, fieldwork was limited to only the activities necessary to ensure the safety of the public, the workers, and the environment (DOE 2020, 700826). Samples scheduled to be collected in the third quarter of MY 2020 were canceled because of EMCA status. Phased resumption of operations at Los Alamos National Laboratory began on June 8, 2020. Samples for the Los Alamos and Pueblo Canyon and Pajarito Canyon watersheds were collected in the fourth quarter of MY 2020 and are included in this PMR. In addition, a reduced number of locations, limited to those accessible by vehicle or short hike, were sampled during the MY 2021 Quarter 1 White Rock sampling campaign in order to maintain COVID-19 safe protocols.

In addition to results from the 16 PMEs listed in the table above, results are reported for the previous 4 PMEs as well as for earlier General Surveillance monitoring group PMEs that have not yet been reported because the validated laboratory data were not available at the time of the previous General Surveillance PMR publications.

The PMEs reported in this PMR included sampling of spring, groundwater well, and well screen locations pursuant to the "Interim Facility-Wide Groundwater Monitoring Plan for the 2020 Monitoring Year, October 2019–September 2020" (hereafter referred to as the 2020 IFGMP) (N3B 2019, 700451) and the "Interim Facility-Wide Groundwater Monitoring Plan for the 2021 Monitoring Year, October 2020–September 2021, Revision 1" (hereafter referred to as the 2021 IFGMP) (N3B 2020, 701041), both prepared in accordance with the 2016 Compliance Order on Consent (Consent Order). Base flow locations will be reported within the 2021 annual base flow PMR.

Section IX of the Consent Order describes the role of data screening in the corrective action process. Screening values are used to identify the *potential* for unacceptable risk resulting from the presence of contaminants in groundwater and surface water. Screening values for evaluating IFGMP monitoring data include New Mexico Water Quality Control Commission (NMWQCC) groundwater standards, U.S. Environmental Protection Agency (EPA) maximum contaminant levels (MCLs), NMED screening levels for tap water, and EPA regional screening levels for tap water. Additional risk evaluation is required to determine the potential need for cleanup (corrective action) if results indicate that contaminants pose an unacceptable risk.

This report presents the following:

- general background information on the General Surveillance monitoring group;
- scope of activities for the General Surveillance monitoring group;
- regulatory criteria for screening analysis;
- monitoring results (field parameters, groundwater elevations);
- analytical data results; and
- a summary of the monitoring data and the results of screening analysis.

All information associated with analysis of radionuclides is voluntarily provided to NMED in accordance with U.S. Department of Energy (DOE) policy.

1.1 Background

Most of the monitoring locations discussed in the 2020 IFGMP (N3B 2019, 700451) and 2021 IFGMP (N3B 2020, 701041) are assigned to area-specific monitoring groups related to project areas that may be located in more than one watershed. Locations not included within one of these six area-specific monitoring groups are assigned to the General Surveillance monitoring group. General Surveillance monitoring group locations are sited across the Pajarito Plateau in all major watersheds (Figure 1.1-1). Some are upgradient of project-specific areas or are in areas where contamination was historically present but where concentrations have since decreased and are stable and below standards (screening levels). Most General Surveillance monitoring group locations are well characterized and have a long history of sampling data. Some locations show little or no contamination, while others show residual contamination from past operations or effluent releases. The residual contamination may be present in alluvial groundwater and occasionally in perched-intermediate groundwater. In many cases, contaminant concentrations are fairly steady over time or decrease as a result of reduction of sources over the years.

Monitoring objectives for the General Surveillance monitoring group locations are as follows:

- continue monitoring long-term water-quality trends;
- continue verifying decreased contaminant trends in some watersheds (Los Alamos, Sandia, and Mortandad);
- monitor for potential impacts from ongoing operations under DOE requirements for environmental surveillance; and
- continue surveillance for potential impacts to the groundwater at Los Alamos National Laboratory (the Laboratory), as expressed at the springs in White Rock Canyon.

This annual PMR presents General Surveillance monitoring group results for the Los Alamos and Pueblo Canyon (Figure 1.1-2), Mortandad and Sandia Canyon (Figure 1.1-3), Water Canyon/ Cañon de Valle and Ancho Canyon (Figure 1.1-4), White Rock Canyon (Figure 1.1-5), and Pajarito Canyon watersheds (Figure 1.1-6).

Other locations monitored outside of the General Surveillance monitoring group can be found in the six area-specific monitoring groups, listed below.

Watershed	Area-Specific Monitoring Group	Purpose
Los Alamos and Pueblo Canyon	Technical Area 21 (TA-21) monitoring group	Monitor past operations from TA-21, including locations DP West and DP East. Operations included plutonium processing, production of weapons initiators, and tritium research.
Mortandad and Sandia Canyon	Chromium Investigation monitoring group (Mortandad and Sandia Canyons)	Characterization and fate and transport of chromium contamination in perched-intermediate groundwater and the regional aquifer, and monitoring historical releases from Outfall 051 discharged from the Radioactive Liquid Waste Treatment Facility.
	Material Disposal Area (MDA) C monitoring group (Mortandad Canyon)	Monitoring for potential releases from inactive waste disposal units at MDA C.
Water Canyon/ Cañon de Valle	TA-16 260 monitoring group, and Base Flow monitoring group	Monitor contaminants released from Consolidated Unit 16-021(c)-99 and the TA-16 260 Outfall (hereafter 260 Outfall), as well as other TA-16 sites. The 260 Outfall is a former high explosives- (HE-) machining outfall. TA-16 developed explosive formulations, cast and machined explosive charges, and assembled test explosives components.
	MDA AB monitoring group	Support corrective measures for solid waste management units (SWMUs) and areas of concern (AOCs) at MDA AB, an underground nuclear weapons component testing site. Testing involved large inventories of radioactive and hazardous materials.
Pajarito Canyon	TA-54 monitoring group	Support corrective measures for SWMUs and AOCs (particularly MDAs G, H, and L), and monitor all aspects of TA-54.

Los Alamos Canyon and Pueblo Canyon Watershed

The entire Los Alamos Canyon watershed includes Pueblo, Guaje, Rendija, Bayo, and Barrancas Canyons, as well as smaller tributary canyons (e.g., Acid and DP Canyons) (Figures 1.1-1 and 1.1-2). The highest point in the watershed is at the summit of Pajarito Mountain at an elevation of 10,441 ft above sea level (asl). The watershed extends eastward from the headwaters across the Pajarito Plateau for approximately 18.9 mi to the confluence with the Rio Grande at an elevation of 5504 ft asl. Los Alamos Canyon heads on U.S. Forest Service (USFS) land, crosses approximately 8 mi of Laboratory land, and then crosses Pueblo de San Ildefonso land for approximately 4.7 mi before joining the Rio Grande. Los Alamos Canyon drains an area of approximately 10.8 mi^2 upstream from its confluence with Pueblo Canyon and 21.0 mi^2 upstream from its confluence with Bayo Canyon (inclusive of Pueblo Canyon). The Los Alamos Canyon watershed has a combined drainage area of 59 mi^2.

Pueblo Canyon heads on USFS land, crosses 4.2 mi of Los Alamos County land, and then crosses 2.5 mi of Laboratory land, where it joins Los Alamos Canyon just upcanyon of the Pueblo de San Ildefonso boundary (Figures 1.1-1 and 1.1-2). Pueblo Canyon has a total drainage area of approximately 8.4 mi^2.

Mortandad Canyon and Sandia Canyon Watersheds

Mortandad Canyon includes Pratt Canyon, a short tributary that heads in TA-35, as well as an unnamed tributary canyon that heads in TA-05 (Figures 1.1-1 and 1.1-3). The Mortandad Canyon watershed heads on the Pajarito Plateau on Laboratory land in TA-03 at an elevation of approximately 7400 ft asl and extends approximately 7 mi to NM 4 on Pueblo de San Ildefonso land at an elevation of approximately 6450 ft asl, approximately 3 mi upcanyon from the Rio Grande. The watershed upcanyon of NM 4 has a drainage area of 3.3 mi^2, of which 60% is on Laboratory land and the remaining 40% is on Pueblo de San Ildefonso land. Effluent Canyon heads in TA-48 and has a length of approximately 0.5 mi and a drainage area of 0.1 mi^2, entirely on Laboratory land. Ten Site Canyon heads in TA-50 and has a length of approximately 1.8 mi and a drainage area of 0.3 mi^2, entirely on Laboratory land.

Sandia Canyon heads on the Pajarito Plateau in TA-03, has a maximum elevation of approximately 7600 ft asl, and extends approximately 10.9 mi to the Rio Grande at an elevation of approximately 5445 ft asl (Figures 1.1-1 and 1.1-3). The watershed has a drainage area of 5.5 mi^2, of which 45% is on Laboratory land, 39% is on Pueblo de San Ildefonso land, 15% is within Bandelier National Monument, and 1% is on private land. The part of the watershed upcanyon from NM 4 and White Rock, the primary focus of this investigation, has a drainage area of 2.6 mi^2, of which 96% is on Laboratory land, 3% is on Pueblo de San Ildefonso land, and 1% is on private land.

Water Canyon/Cañon de Valle and Ancho Canyon Watersheds

Tributaries within Water Canyon/Cañon de Valle include Martin Spring, Fishladder, Indio, Potrillo, Fence, and numerous smaller tributary canyons. The Water Canyon/Cañon de Valle watershed is located in the southern portion of the Laboratory (Figures 1.1-1 and 1.1-4). Water Canyon is an east-to-southeast-trending drainage originating on the flanks of the Sierra de los Valles in Bandelier National Monument. Water Canyon remains in Bandelier National Monument for 0.2 mi and then passes through 3.2 mi of the Santa Fe National Forest before it crosses into the Laboratory at the western boundary of TA-16. The drainage extends east-southeast approximately 10.7 mi across the entire Laboratory to its confluence with the Rio Grande in White Rock Canyon. The total drainage area for Water Canyon above the Rio Grande, including Cañon de Valle and other tributaries, is 19.1 mi^2, and the total drainage length is about 14.1 mi. Cañon de Valle, the largest tributary to Water Canyon, also originates on the flanks of the Sierra de Los Valles in the Valles Caldera National Preserve. Cañon de Valle remains on the Valles Caldera National Preserve for 0.8 mi and then passes through 3.1 mi of the Santa Fe National Forest before it crosses into the Laboratory at the western boundary of TA-16. It extends east-southeast

across the Laboratory from TA-16 to its confluence with Water Canyon at the boundary between TA-15 and TA-37. The Cañon de Valle watershed has a drainage area of 4.4 mi^2 and a channel length of 7.7 mi. S-Site Canyon originates in TA-16 near the west-central portion of the Water Canyon watershed and extends approximately 2.7 mi east-southeast to its confluence with Water Canyon in TA-37. It has a drainage area of approximately 0.8 mi^2. Most of the Water Canyon watershed, approximately 65% (including all tributaries), is within the boundaries of the Laboratory. Approximately 28% of the watershed is on Santa Fe National Forest land, 4% is within the Valles Caldera National Preserve, 2% is within Bandelier National Monument, and 2% is on private land or Los Alamos County land in White Rock.

Pajarito Canyon Watershed

The Pajarito Canyon watershed heads in the Sierra de los Valles (the eastern Jemez Mountains) at Pajarito Mountain at an elevation of 10,441 ft asl and extends approximately 13 mi to the Rio Grande at an elevation of approximately 5410 ft asl (Figures 1.1-1 and 1.1-6). The watershed has a drainage area of 13 mi^2, of which 57% is on Laboratory land, 27% is on USFS land in the Santa Fe National Forest, a small area (0.1%) is on Valles Caldera National Preserve land, and the remaining 16% is on private land or land owned by Los Alamos County. Approximately 58% of the length of Pajarito Canyon, or 8.5 mi, is on Laboratory land between NM 501 (West Jemez Road) and NM 4. The three largest tributaries to Pajarito Canyon are Threemile Canyon, Twomile Canyon, and the south fork of Pajarito Canyon. Threemile Canyon heads in TA-14 and has a length of approximately 3.7 mi and a drainage area of 1.7 mi^2, entirely on Laboratory land. Twomile Canyon heads in the Sierra de los Valles and has a length of approximately 5.8 mi and a drainage area of 3.1 mi^2, 70% on Laboratory land. The south fork of Pajarito Canyon also heads in the Sierra de los Valles and has a length of approximately 2.9 mi and a drainage area of 1.0 mi^2, 37% on Laboratory land.

White Rock Canyon Watershed

The White Rock Canyon springs are located along the Rio Grande at the eastern border of the Laboratory, on Los Alamos County land, and on land belonging to Pueblo de San Ildefonso. The springs serve as monitoring points to detect possible discharges of contaminated groundwater from beneath the Laboratory into the Rio Grande. The White Rock Canyon springs are some of the most frequently monitored locations in or next to the Laboratory. Most of the major springs have been sampled regularly since the late 1960s, with some sampled since the early 1950s.

TA-70, which lies to the north of TA-33, is a buffer area where no Laboratory activities have occurred. There are no SWMUs or AOCs within TA-70. Adjoining TA-70 to the north are low- to moderate-density residential areas in White Rock and a mix of private property and Los Alamos County land. A municipal sanitary treatment plant discharges effluent into Mortandad Canyon just above the river at the northern county boundary. Pueblo de San Ildefonso property borders Los Alamos County on the north; this land is undeveloped. Pueblo de San Ildefonso operates numerous water-supply wells on both sides of the Rio Grande, and the City of Santa Fe operates the Buckman well field on the east side of the Rio Grande across from White Rock.

The Rio Grande flows from northeast to southwest near the Laboratory and forms part of the eastern Laboratory boundary (Figures 1.1-1 and 1.1-5).

2.0 SCOPE OF ACTIVITIES

All active monitoring locations in the General Surveillance monitoring group are located within the Los Alamos and Pueblo Canyon, Mortandad and Sandia Canyon, Water Canyon/Cañon de Valle, Ancho Canyon, White Rock Canyon, and Pajarito Canyon watersheds. Monitoring locations include

25 springs, 12 wells completed within the alluvial groundwater, 8 wells completed within the perched-intermediate groundwater, and 16 wells completed within the regional aquifer. In addition, water levels are monitored at 6 wells completed within the alluvial groundwater. One of the 8 wells completed within the perched-intermediate groundwater is on the watch list.

Watch list wells are identified by N3B and NMED as perched-intermediate and regional groundwater monitoring wells for which water-quality data for certain constituents are not representative or are of questionable representativeness. Wells are assigned to the watch list if site-specific criteria are met. Data examined for the assessment include field parameters associated with samples at the time of collection, major-ion concentrations, trace-metal concentrations, and detections of organic constituents. The assessments are based on site-specific geochemical criteria. The complete index of watch-list locations can be found in Appendix E of the 2020 and 2021 IFGMPs (N3B 2019, 700451, N3B 2020, 701041).

The following well screen is on the watch list:

- R-12 screen 1 is on the watch list because reducing conditions appear to persist from residual drilling fluids as indicated by low dissolved oxygen (DO) and elevated iron and manganese. Reducing conditions yield nonrepresentative data. Sampling is completed for low-level tritium only because concentrations are not affected by reducing conditions; it therefore provides a good indicator of the potential presence of contamination.

Groundwater samples collected during the PMEs were analyzed for all or some of the following analytical groups as specified in the 2020 and 2021 IFGMPs (N3B 2019, 700451, N3B 2020, 701041): metals; volatile organic compounds (VOCs); semivolatile organic compounds; low-level 1,4- dioxane; low-level nitrosamines; per- and polyfluoroalkyl substances (PFAS); polychlorinated biphenyls; HE; dioxins and furans; radionuclides (including low-level tritium); and general inorganic chemicals (including perchlorate). The same samples were also analyzed for the following field parameters: DO, flow rate (in gallons per minute [gpm]), oxygen-reduction potential, pH, specific conductance, temperature, and turbidity.

Purge water is managed and characterized in accordance with the relevant version of the waste characterization strategy form “Groundwater Monitoring Pursuant to IFGMP and Chromium Performance Monitoring” (N3B 2020, 701093). Purge water is stored until characterization is complete, and if requirements are met, the purge water can be land-applied in accordance with the standard operating procedure (SOP) “Land Application of Groundwater” (N3B-SOP-ER-3006), and the standing order “Land Application of Groundwater” (N3B-SO-ER-0003), which implements the NMED-approved decision tree for land application of drilling, development, rehabilitation, and purge water.

Table 2.0-1 provides information about each well sampled during the PMEs. Information provided includes the well location name and watershed; the MY and quarter of the sampling event; the sample collection date; each well’s screened interval with top and bottom screen depths; and the casing volume, purge volume, and purge or flow rate for each sampling event.

Monitoring locations are shown in Figures 1.1-2 through 1.1-6, which include the watersheds of Los Alamos and Pueblo Canyons, Mortandad and Sandia Canyons, Water Canyon/Cañon de Valle and Ancho Canyon, White Rock Canyon, and Pajarito Canyon, respectively.

2.1 PME Observations and Deviations from Planned Scope

Table 2.1-1 summarizes the observations and Table 2.1-2 summarizes the deviations from the planned monitoring scope for this annual PMR.

The 2020 General Surveillance PME for MY 2020 Quarter 3 Los Alamos and Pueblo Canyon and Pajarito Canyon watersheds was canceled because of the COVID-19 pandemic. These locations were sampled in MY 2020 Quarter 4 and are included in this PMR.

The MY 2020 Quarter 4 Water Canyon/Cañon de Valle PME was canceled because reconfigurations were not complete or there was insufficient water to sample.

The MY 2021 Quarter 1 White Rock Canyon General Surveillance sampling campaign was abbreviated because of the ongoing COVID-19 pandemic and social distancing guidelines. Sampling was limited to monitoring locations accessible by vehicle or short hike. Locations were sampling was canceled are listed in Table 2.1-2.

The MY 2020 Quarter 4 Ancho Canyon PME was canceled because of mechanical issues.

3.0 REGULATORY CRITERIA

Regulatory criteria related to groundwater quality form the basis for the screening values with which groundwater monitoring results are compared in this PMR. These criteria include the NMWQCC groundwater standards, EPA MCLs, NMED screening levels for tap water, and EPA regional screening levels for tap water. These criteria are used to screen results in accordance with the process specified in Section IX of the Consent Order, as listed in Table 3.0-1.

Monitoring data are evaluated using the screening process described below. The sources for standards and screening levels from which specific screening values are established are listed in Table 3.0-1 based on the following criteria:

- For each individual substance, the lower concentration of the NMWQCC groundwater standard or the EPA MCL is used as the screening value.
- If the NMWQCC groundwater standard or the EPA MCL has not been established for a specific substance for which toxicological information is published, the NMED screening level for tap water is used as the groundwater screening value. NMED screening levels are established for either a cancer- or noncancer-risk type; for the cancer-risk type, screening levels are based on a 1×10^{-5} excess cancer risk. This report was prepared using the June 2019 NMED “Risk Assessment Guidance for Site Investigations and Remediation” (NMED 2019, 700550).
- If the NMED screening level for tap water has not been established for a specific substance for which toxicological information is published, the EPA regional screening level for tap water is used as the groundwater screening value. The EPA screening levels are established for either a cancer- or noncancer-risk type. For the cancer-risk type, the Consent Order specifies screening at a 1×10^{-5} excess cancer risk. The EPA screening levels for tap water are at 1×10^{-6} excess cancer risk; therefore, 10 times the EPA 1×10^{-6} screening levels are used in the screening process. This report was prepared using the May 2021 EPA regional screening levels for tap water (http://www.epa.gov/risk/risk-based-screening-table-generic-tables).
- The NMWQCC groundwater standards apply to specified contaminants in the dissolved (filtered) portion of samples. However, the standards for mercury and organic compounds apply to the concentrations of the contaminants in unfiltered samples. For this report, EPA MCLs are applied to contaminant concentrations in both filtered and unfiltered sample results.

4.0 MONITORING RESULTS

4.1 Methods and Procedures

All methods and procedures used to perform the field activities associated with the data reported in this PMR are documented in the 2020 IFGMP (N3B 2019, 700451) and 2021 IFGMP (N3B 2020, 701041).

4.2 Comparison of Target Analytes and Method Detection Limits

Several analytes have a range of method detection limits (MDLs). For some of these analytes, the current MDL is much lower than former MDLs for earlier analyses. Table 4.2-1 presents a list of target analytes with MDLs equal to or above screening values. Table 4.2-2 presents a list of analytes where the lower range of MDLs is below the screening value but the upper portion of the range is above the screening value. Target analytes with MDLs entirely below the screening value are not listed. The analytical method and analytical laboratory are included in the tables for reference.

4.3 Field Parameter Results

Appendix A presents the field parameter measurements associated with the sampling and analytical data reported in this PMR, including DO, flow rate, oxygen-reduction potential, pH, specific conductance, temperature, and turbidity. Table 2.1-2 notes any instances where the parameter stabilization requirement could not be met.

4.4 Groundwater Elevations

The groundwater elevations are measured at each groundwater monitoring location before purging and sampling at that location as required by the Consent Order.

In addition to collecting groundwater-elevation data before purging and sampling, N3B collects groundwater-elevation data “continuously” (e.g., hourly, daily) for most monitoring locations, and these data are voluntarily presented in this PMR. Any gaps in the continuous groundwater-elevation records presented in this PMR are a result of one or more of the following conditions:

- The well is dry.
- The well is not equipped with a pressure (level) transducer.
- The water level is below the transducer.
- The transducer is not functioning properly (including failure).
- The transducer is temporarily removed from the well for maintenance and/or calibration.

Data gaps exist for the following locations:

- CDBO-6: Water was in well sump for the entire period of record.
- LAO-1.6g: The well does not contain a transducer.
- LAO-3a: Water was in well sump from 1/28/2021 through 02/16/2021. Data from 6/3/2021 through 6/16/2021 are not included due to a recording error.
- LAO-4.5c: The water level was below the transducer for the entire period of record.
- LAUZ-1: The well does not contain a transducer.

- LLAO-1b: Water was in well sump for the entire period of record.
- MCO-4b: The water level was below the transducer for the entire period of record.
- MCO-5: The water level was below the transducer for the entire period of record.
- MCO-6: The water level was below the transducer from August 26, 2020, through the end of the period of record.
- PAO-2: Water was in well sump for the entire period of record.
- PAO-5n: Water was in the well sump from September 27, 2020, through December 11, 2020.
- PAO-7b2: Water was in well sump for the entire period of record.
- PAO-8: Water was in well sump for the entire period of record.
- R-19 (all screens): Transducers were pulled for Westbay conversion on March 23, 2019. The transducers were reinstalled but not validated by the time of the PMR publication.
- R-31 (all screens): Transducers were pulled for Westbay conversion. The transducers were reinstalled but not validated by the time of the PMR publication.
- WCO-1r: Field crews were unable to download transducer data in time because of PED issues at the Weapons Facilities Operations site.

Groundwater-elevation data from the end of the previous PMEs and through the end of the PMEs in this report are presented in Appendix B (on CD included with this document), and include all continuous groundwater-elevation data. Locations assigned to water-level monitoring only are LAO-4.5c, PAO-2, MCO-2, MCO-4B, MCO-6, and PCAO-7b2. Groundwater-elevation measurements are shown graphically on Plate 1.

For wells equipped with transducers, the reported groundwater elevation was the first measurement taken on each day. Figure 4.4-1 shows regional groundwater surface and flow direction from the first day of the PME. No perched-intermediate groundwater contours are shown. However, all groundwater-elevation data for locations with transducers are reported in Appendix B and shown on Plate 1.

5.0 ANALYTICAL DATA RESULTS

5.1 Methods and Procedures

All methods and procedures used to perform the analysis for the data reported in this PMR are documented in the 2020 and 2021 IFGMPs (N3B 2019, 700451; N3B 2020, 701041). Samples and field-data collection are conducted using SOPs that are part of a comprehensive quality assurance/quality control (QA/QC) program. These SOPs are listed and described in Appendix B of the IFGMPs.

Sampling and analysis plans (SAPs) are created using IFGMP Tables 1.8-1, 1.11-1, and 8.3-1 (N3B 2020, 701041). SAPs include additional field collection, transportation, and field QA/QC criteria as identified in the N3B data quality objectives (DQOs) and in the Consent Order. A sample collection log is created from the SAP and is used to maintain a chain-of-custody (COC) document and an analytical request form.

Field QA/QC sampling and analysis is employed as a facet of the QA/QC program to assist in qualifying field sample analytical results. These samples include field blanks (FBs), equipment rinsate blanks (EQBs), performance evaluation blanks (PEBs), field trip blanks (FTBs), and field duplicates (FDs).These field QA/QC samples support monitoring the quality of field sample collection, shipping processes, and

analytical laboratory processes. Additional description regarding these types of QA/QC samples is provided in Appendix D or the IFGMPs.

Following sample collection, sampling personnel deliver the samples and the sample collection log to sample management personnel at the N3B Sample Management Office. An analytical COC document is then created, which includes the field sample identification (ID) number, the date and time of field sample collection, the analytical parameters group code, and the number of bottles for each analytical parameters group. Samples are then shipped to analytical laboratories for analysis.

In addition to analyzing the field samples and field QA/QC samples, analytical laboratories also employ laboratory batch QA/QC samples. These include matrix spikes, duplicates, method blanks, and laboratory control samples that are prepared and analyzed by the laboratories to monitor their analytical process quality.

The analytical data are submitted by the analytical laboratory and uploaded to the N3B Environmental Information Management (EIM) database. The received data are then independently validated through the N3B data validation process, per the DQOs described below, to qualify the data.

Analytical results meet the N3B minimum DQOs as outlined in N3B-PLN-SDM-1000, “Sample and Data Management Plan.” N3B-PLN-SDM-1000 sets the validation frequency criteria at 100% Level 1 examination and Level 2 verification of data and at 10% minimum Level 3 validation of data. A Level 1 examination assesses the completeness of the data as delivered from the analytical laboratory, identifies any reporting errors, and checks the usability of the data based on the analytical laboratory’s evaluation of the data. A Level 2 verification evaluates the data to determine the extent to which the laboratory met the analytical method and the contract-specific QC and reporting requirements. A Level 3 validation includes Levels 1 and 2 criteria and determines the effect of potential anomalies encountered during analysis and possible effects on data quality and usability. A Level 3 validation is performed manually with method-specific data validation procedures. Laboratory analytical data are validated by N3B personnel as outlined in N3B-PLN-SDM-1000; N3B-AP-SDM-3000, “General Guidelines for Data Validation”; N3B-AP-SDM-3014, “Examination and Verification of Analytical Laboratory Data”; and additional method-specific analytical data validation procedures. All associated validation procedures have been developed, where applicable, from the EPA QA/G-8, “Guidance on Environmental Data Verification and Data Validation” (https://www.epa.gov/sites/production/files/2015-06/documents/g8-final.pdf), the “Department of Defense (DoD)/Department of Energy (DOE) Consolidated Quality Systems Manual (QSM) for Environmental Laboratories” (https://denix.osd.mil/edqw/documents/manuals/qsm-version-5-3-final/), the EPA “National Functional Guidelines for Data Review” (https://www.epa.gov/clp/superfund-clp-national-functional-guidelines-nfgs-data-review), and the American National Standards Institute/American Nuclear Society 41.5, “Verification and Validation of Radiological Data for Use in Waste Management and Environmental Remediation.”

Validation qualifiers and reason codes applied during this process are also reviewed and approved by an N3B chemist to assess data usability and quality. The EIM data are then made available to the public in the Intellus New Mexico database (https://intellusnm.com/).

5.2 Analytical Data

Appendix C presents the analytical data for the PMEs reported in this PMR and from the previous four sampling events. Table C-1 of the appendix contains all data for this reporting period. Table C-2 contains all detections of respective analytes from this reporting period plus the results from the four previous sampling events. The data were reviewed for compliance with regulatory and N3B requirements and are reported as follows:

- For all data
    - ❖ FD results, reanalysis results, and results of the same analytes from the same sample analyzed by different analytical methods are reported.
    - ❖ Data that are R-qualified (rejected and thus unusable because of analytical problems and/or noncompliance with QA/QC criteria during independent validation) are still reported.
    - ❖ Laboratory QA/QC results, FTB data, FB data, EQB data, and PEB data are not included in the data set.
    - ❖ Tracers used for conceptual models are not reported.
    - ❖ Data for certain target analytes from watch-list wells that are not representative or are of questionable representativeness are not reported.
    - ❖ All other results are reported for all locations.
- For radionuclide data:
    - ❖ Constituents analyzed and reported for the gamma spectroscopy suite include cesium-137, cobalt-60, neptunium-237, potassium-40, and sodium-22.
    - ❖ Americium-241 and uranium-235 data from chemical separation alpha spectroscopy are reported. Gamma spectroscopy results for these analytes are not presented.
    - ❖ All other radionuclide results are reported for all locations.

Multiple analyses of the same analyte in a sample, including dilutions and reanalyses, create multiple results. These multiple results for the same analyte have the same sample ID, analytical laboratory code, and analytical method. Validation determines the more accurate result, which is marked with a best-value flag of “Y” (yes). The other results for that analyte, which were validated to be of lower quality, are assigned a best-value flag of “N” (no). The best-value flag is included in Appendix C.

Appendix D presents each analytical result detected at a concentration of greater than half the applicable screening value. Results with a best-value flag of “N” are included in Appendix D but not discussed in the text.

Table 5.2-1 and Figures 5.2-1 through 5.2-4, present analytical results detected at concentrations greater than screening values.

Graphs in Appendix E display analyte concentration histories for monitoring group locations where the analyte was detected above the screening value at least once in the following historical set, which includes this PME in addition to data from the previous 3 yr, if available. Appendix E may include instances in which the analyte data are evaluated using a higher screening value than that used to evaluate previously reported analyte data. For example, the current screening value of 13.8 µg/L for perchlorate is greater than the former screening value of 4 µg/L, which was used to evaluate previously

reported analyte data. If there are exceedances of the current screening value by the data reported in this PMR, the graphs depict the current analyte screening value. If there are no exceedances of current values, but at least one exceedance of the former (lower) screening value by the previously reported analytical data, the graphs depict the former lower screening value. Magenta lines indicate the PMR reporting period. Results with a best value flag of "N" are not included in Appendix E.

The analytical laboratory reports, including COC forms and data validation forms, are provided in Appendix F (on DVD included with this document).

5.2.1 Groundwater

Table 5.2-1 shows that 20 groundwater analytical results at 10 locations reported in this PMR were above applicable screening values. These 20 screening value exceedances were for the following 8 analytes: filtered aluminum; filtered chloride; unfiltered 1,4-dioxane; unfiltered indeno(1,2,3-cd)pyrene; filtered iron; filtered manganese; unfiltered total PFAS (the combined value of perfluorohexanesulfonic acid, perfluorooctanesulfonic acid, and perfluorooctanoic acid); and unfiltered strontium-90.

Springs

Sacred Spring

For the October 1, 2020, sampling event at Sacred Spring, filtered manganese was detected at 211 µg/L. This concentration was above the NMWQCC groundwater standard (screening level) of 200 µg/L.

The previous range of filtered manganese concentrations detected at Sacred Spring from September 26, 2008, to October 7, 2019, was 35 µg/L to 994 µg/L.

Spring 4

For the October 5, 2020, sampling event at Spring 4, unfiltered indeno(1,2,3-cd)pyrene was detected at 0.37 µg/L. This concentration was above the NMED tap water standard (screening level) of 0.343 µg/L.

The previous range of unfiltered indeno(1,2,3-cd)pyrene concentrations detected at Spring 4 from October 5, 2011, to October 2, 2018, was nondetected to 0.568 µg/L.

Alluvial Monitoring Wells

18-MW-18

For the April 12, 2021, and September 16, 2020, sampling events at 18-MW-18, filtered chloride was detected at 287 mg/L and 332.0 mg/L respectively. These concentrations are above the NMWQCC groundwater standard (screening level) of 250 mg/L.

The previous range of filtered chloride at 18-MW-18 from April 30, 2012, to October 31, 2019, was 206 mg/L to 849 mg/L.

LAO-3a

For the June 16, 2021, and September 10, 2020, sampling events at LAO-3A, unfiltered strontium-90 was detected at 14.7 pCi/L and 9.73 pCi/L respectively. These concentrations are above the EPA MCL standard (screening level) of 8 pCi/L.

The previous range of unfiltered strontium-90 from April 2, 2012, to June 25, 2019, was 11.1 pCi/L to 29.3 pCi/L.

LAUZ-1

For the June 9, 2021, sampling event at LAUZ-1, filtered chloride was detected at 326.0 mg/L. This concentration is above the NMWQCC groundwater standard (screening level) of 250 mg/L.

For the June 9, 2021, sampling event at LAUZ-1, filtered manganese was detected at 403.0 µg/L, which is above the NMWQCC groundwater standard (screening level) of 200 µg/L.

For the June 9, 2021, sampling event at LAUZ-1, unfiltered total PFAS was detected at 520.0 ng/L, which is above the NMED tap water standard (screening level) for total PFAS of 70 ng/L.

For the June 9, 2021, sampling event at LAUZ-1, unfiltered strontium-90 was detected at 17.1 pCi/L, which is above the EPA MCL standard (screening level) of 8 pCi/L.

The previous range of filtered chloride from March 14, 2011, to September 21, 2018, was 46.2 mg/L to 341 mg/L. The previous range of filtered manganese from March 14, 2011, to September 21, 2018, was 658 µg/L to 2530 µg/L. This is the first sample at this location analyzed for total PFAS, and therefore, there is no historical range. The previous range of unfiltered strontium-90 from March 14, 2011, to September 21, 2018, was 15.6 pCi/L to 64.5 pCi/L.

MCO-7

For the August 18, 2020, sampling event at MCO-7, unfiltered total PFAS was detected at 82.0 ng/L, which is above the NMED tap water standard (screening level) for total PFAS of 70 ng/L.

This is the first sample at this location analyzed for total PFAS, and therefore, there is no historical range.

PAO-5n

For the June 18, 2021, and September 1, 2020, sampling events at PAO-5n, unfiltered total PFAS was detected at 107.6 ng/L and 179.4 ng/L, respectively. These concentrations are above the NMED tap water standard (screening level) for total PFAS of 70 ng/L.

These are the first samples at this location analyzed for total PFAS, and therefore, there is no historical range.

Intermediate Monitoring Wells

03-B-13

For the September 14, 2020, sampling event at 03-B-13, filtered aluminum was detected at 5430.0 µg/L, and filtered iron was detected at 3240.0 µg/L. These concentrations exceed the respective NMWQCC standards (screening levels) of 5000 µg/L and 1000 µg/L.

For the April 13, 2021, sampling event at 03-B-13, unfiltered 1,4-dioxane was detected at 16.9 µg/L, which exceeds the NMED tap water standard (screening level) of 4.59 µg/L.

The previous range of filtered aluminum from October 21, 2011, to April 16, 2019, was from not detected to 11,500 µg/L. The previous range of filtered iron from October 21, 2011, to April 16, 2019, was 55.2 µg/L to 7170 µg/L. The previous range of unfiltered 1,4-dioxane from June 8, 2010, to October 31, 2018, was 5.99 µg/L to 919 µg/L.

POI-4

For the June 10, 2021, and September 8, 2020, sampling events at POI-4, unfiltered total PFAS was detected at 89.7 ng/L and 107.6 ng/L, respectively. These concentrations are above the NMED tap water standard (screening level) for total PFAS of 70 ng/L.

This is the first sample at this location analyzed for total PFAS, and therefore, there is no historical range.

R-3i

For the June 21, 2021, and September 8, 2020, sampling events at R-3i, unfiltered total PFAS was detected at 75.8 ng/L and 84.7 ng/L, respectively. These concentrations are above the NMED tap water standard (screening level) for total PFAS of 70 ng/L.

These are the first samples at this location analyzed for total PFAS, and therefore, there is no historical range.

Regional Monitoring Wells

There were no exceedances detected in the regional monitoring wells for the PMEs reported in this PMR.

5.3 Sampling Program Modifications

As agreed to in the approved MY 2021 IFGMP (N3B 2020, 701041), no additional PFAS sampling will be performed after MY 2021 where no NMWQCC regulatory standard (screening level) was exceeded and two rounds of sampling were completed. VOC sampling was moved from annual to biennial at locations where all historical VOCs are below applicable screening levels. Sampling of dioxins and furans was removed at locations with no historical detections.

6.0 SUMMARY AND INTERPRETATIONS

6.1 Monitoring Results

Appendix A presents the field parameter measurements associated with the sampling and analysis data that are reported in this PMR.

6.2 Analytical Results

6.2.1 Groundwater

Twenty groundwater analytical results reported in this PMR were above applicable screening values (Table 5.2-1). For results above screening values, the types of contaminants detected and their concentrations are consistent with data reported in previous PMRs for this monitoring group with the following exception.

For the June 16, 2021, sampling event at LAO-3A, unfiltered strontium-90 was detected at 9.73 pCi/L. This value is the smallest concentration to date at this location.

6.3 Data Gaps

Table 2.1-2 summarizes the deviations from the planned monitoring scope for this annual PMR.

6.4 Remediation System Monitoring

Remediation system monitoring is not applicable to the General Surveillance monitoring group, as no remediation systems are required for this monitoring group.

7.0 REFERENCES

The following reference list includes documents cited in this report. Parenthetical information following each reference provides the author(s), publication date, and ERID, ESHID, or EMID. This information is also included in text citations. ERIDs were assigned by Los Alamos National Laboratory's (the Laboratory's) Associate Directorate for Environmental Management (IDs through 599999); ESHIDs were assigned by the Laboratory's Associate Directorate for Environment, Safety, and Health (IDs 600000 through 699999); and EMIDs are assigned by N3B (IDs 700000 and above). IDs are used to locate documents in N3B's Records Management System and in the Master Reference Set. The NMED Hazardous Waste Bureau and N3B maintain copies of the Master Reference Set. The set ensures that NMED has the references to review documents. The set is updated when new references are cited in documents.

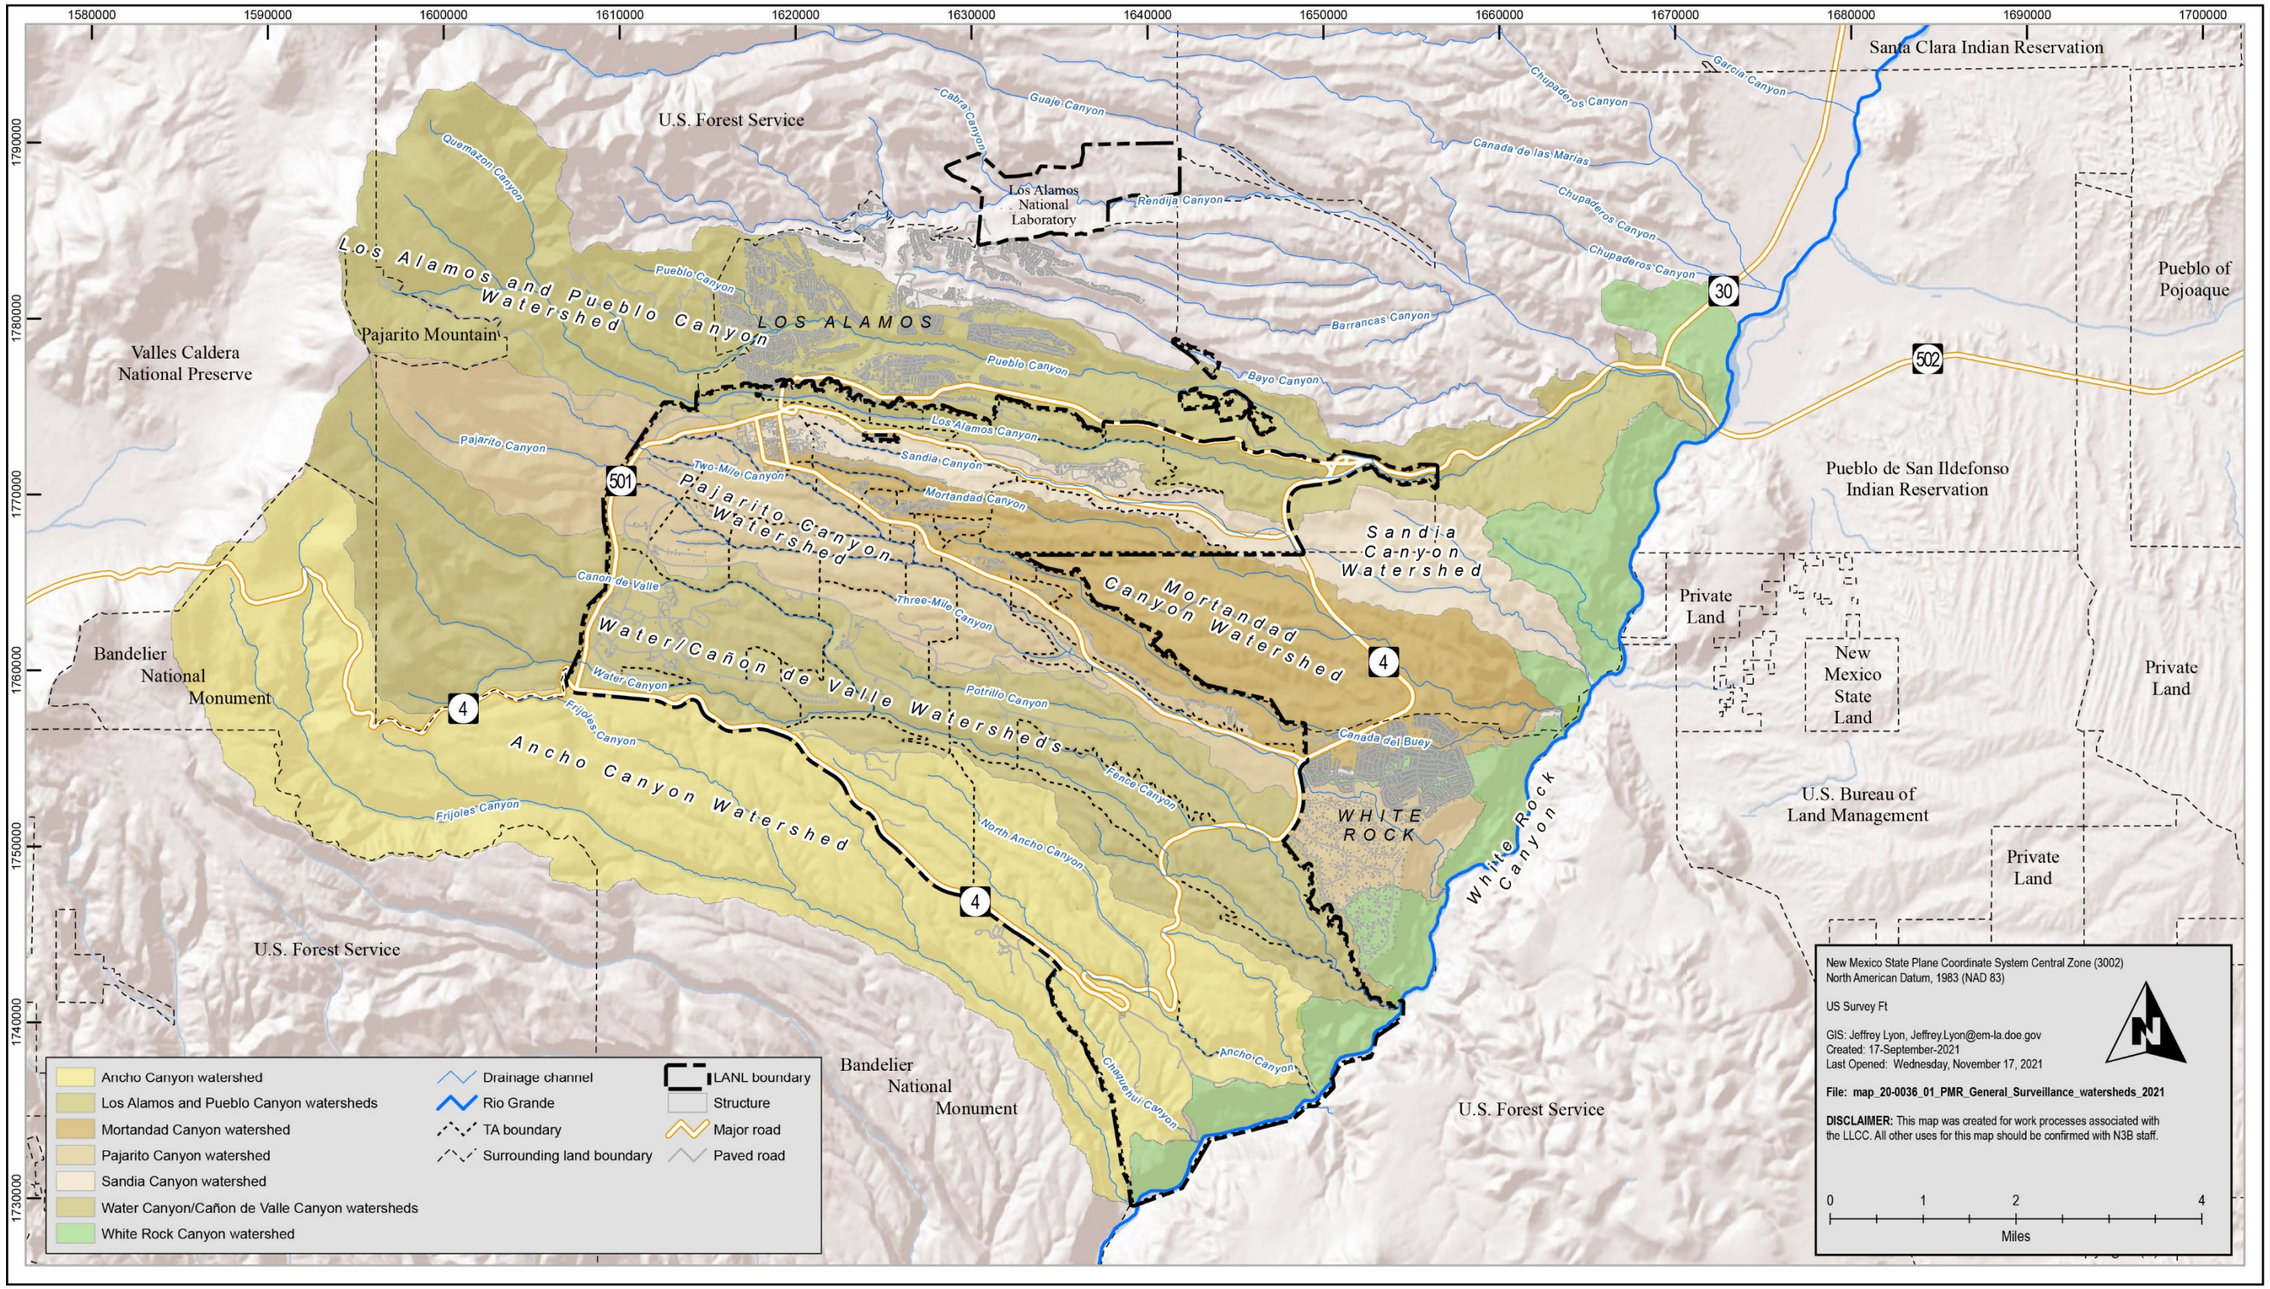

Figure 1.1-1 General Surveillance monitoring group vicinity map

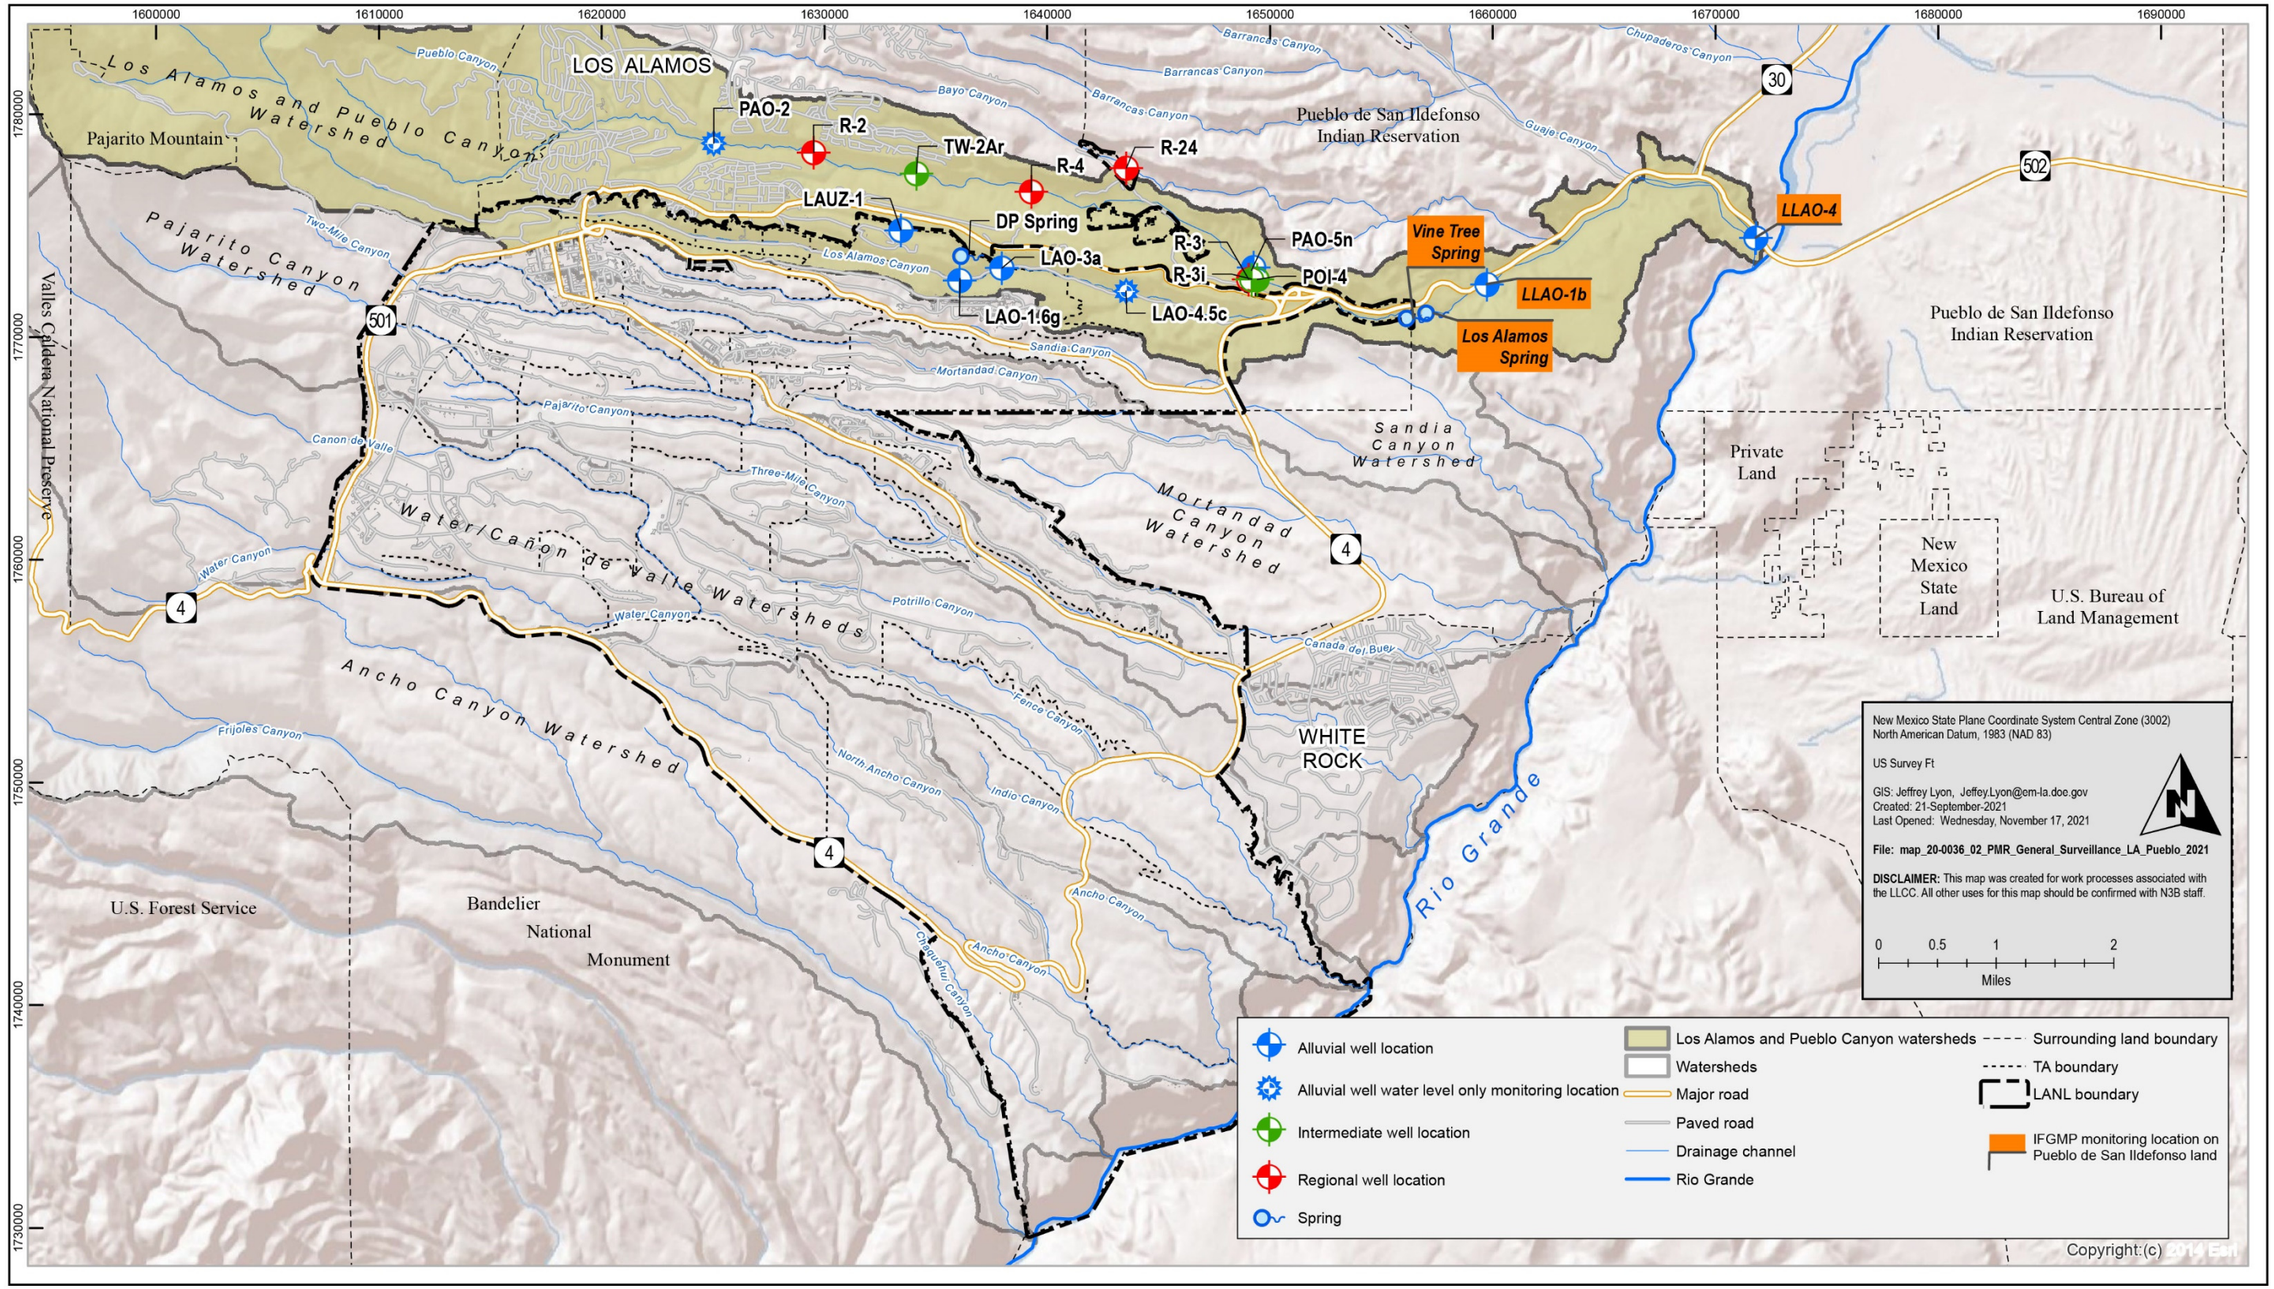

Figure 1.1-2 General Surveillance monitoring group locations in the Los Alamos and Pueblo Canyon watershed

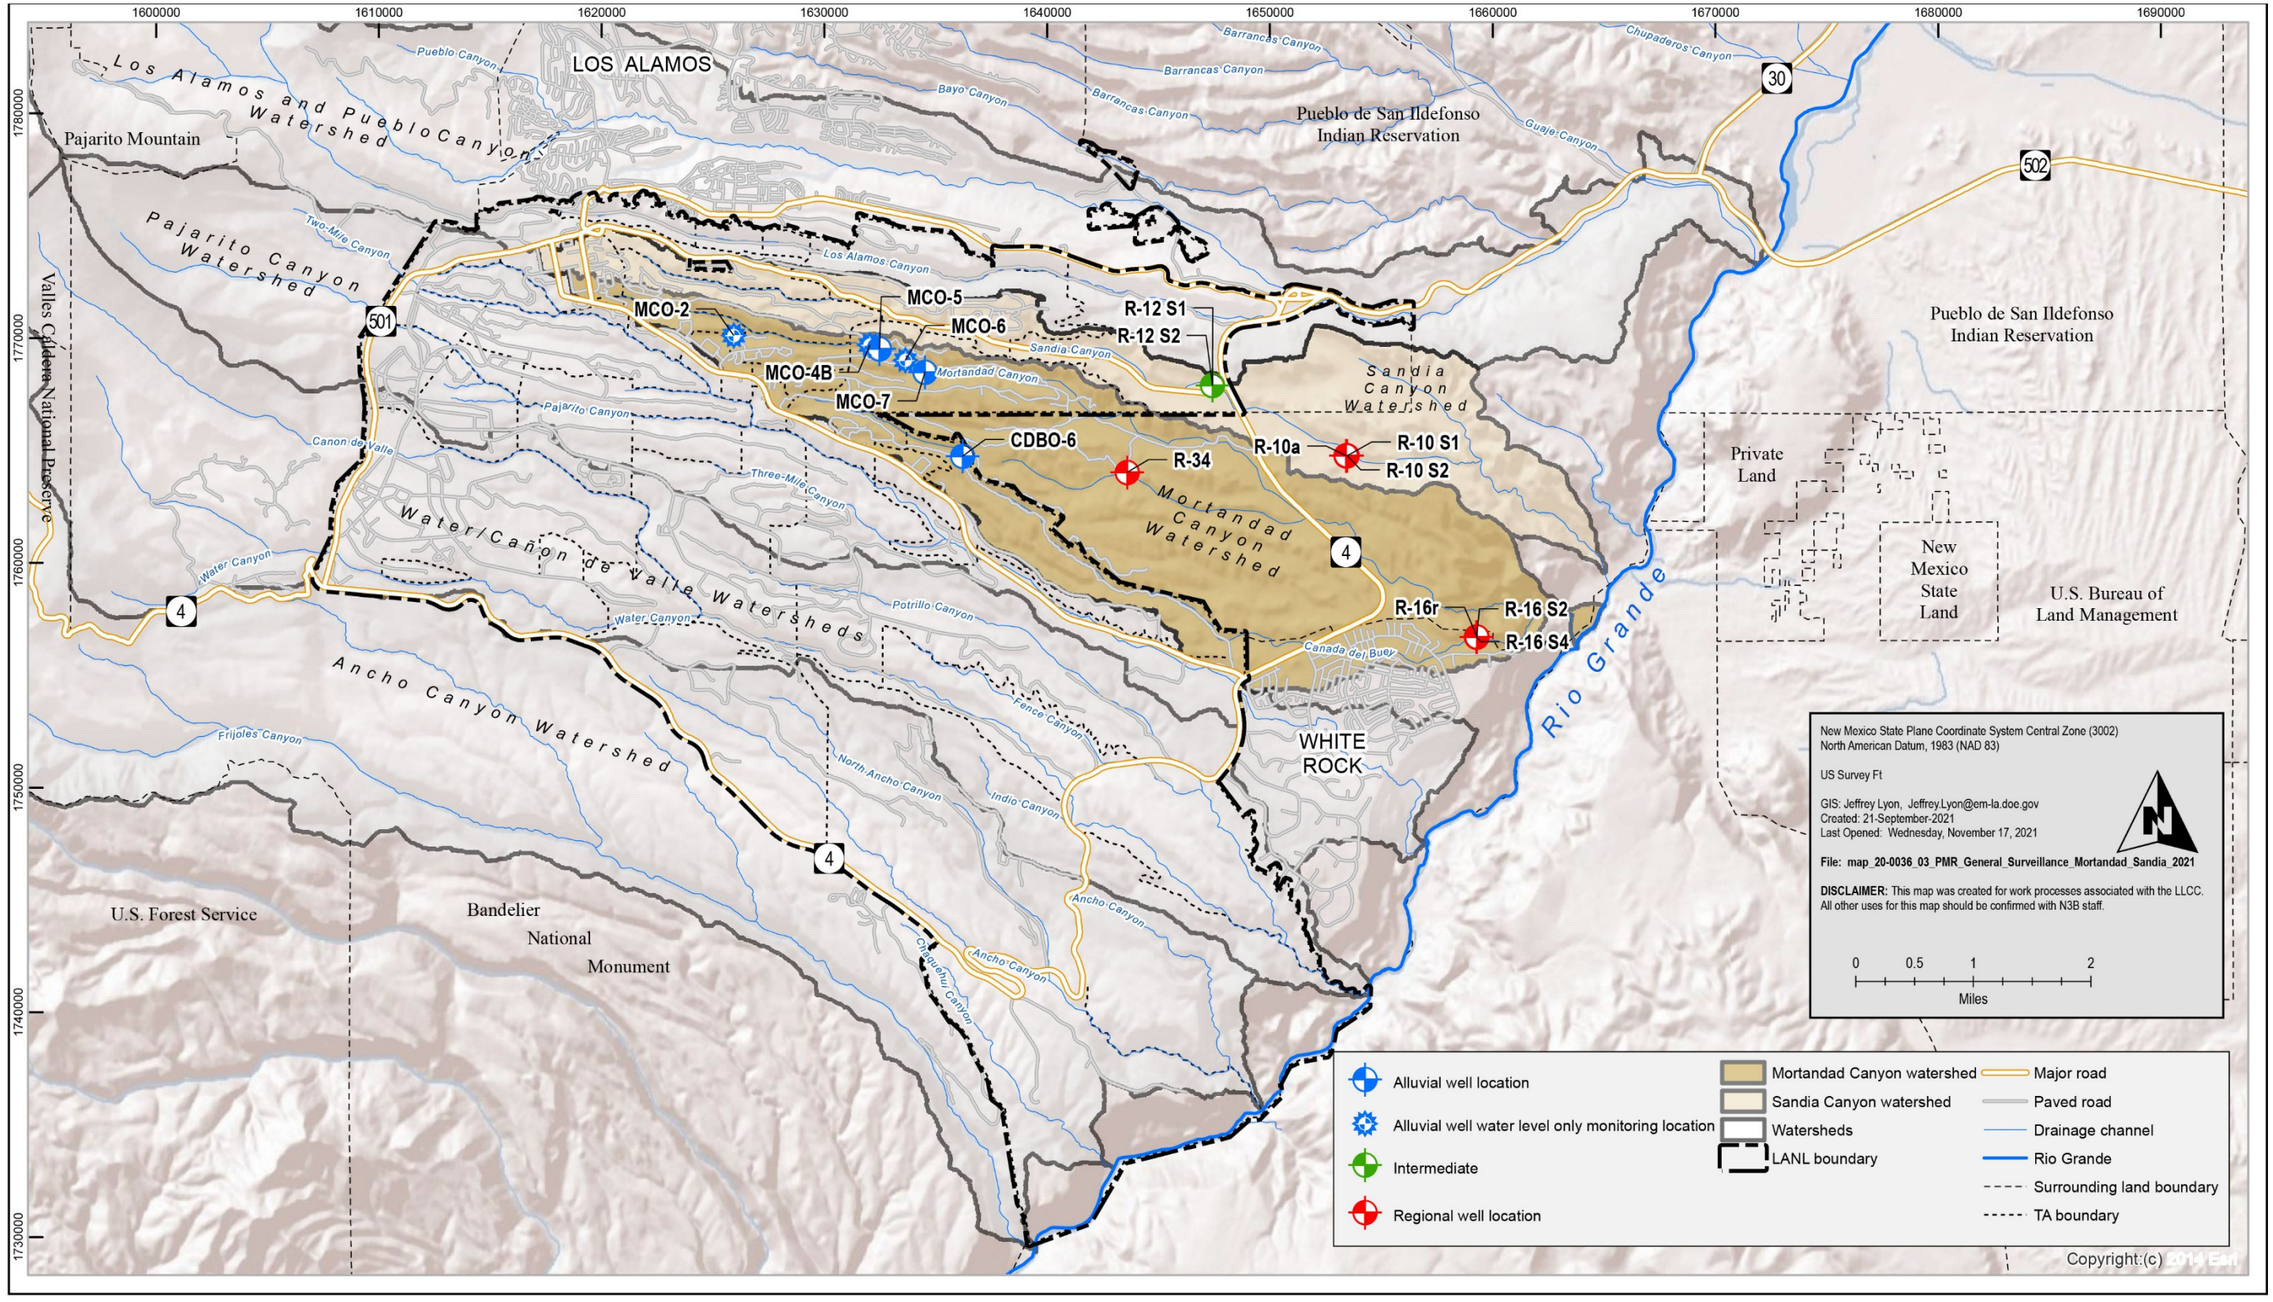

Figure 1.1-3 General Surveillance monitoring group locations in the Mortandad and Sandia Canyon watersheds

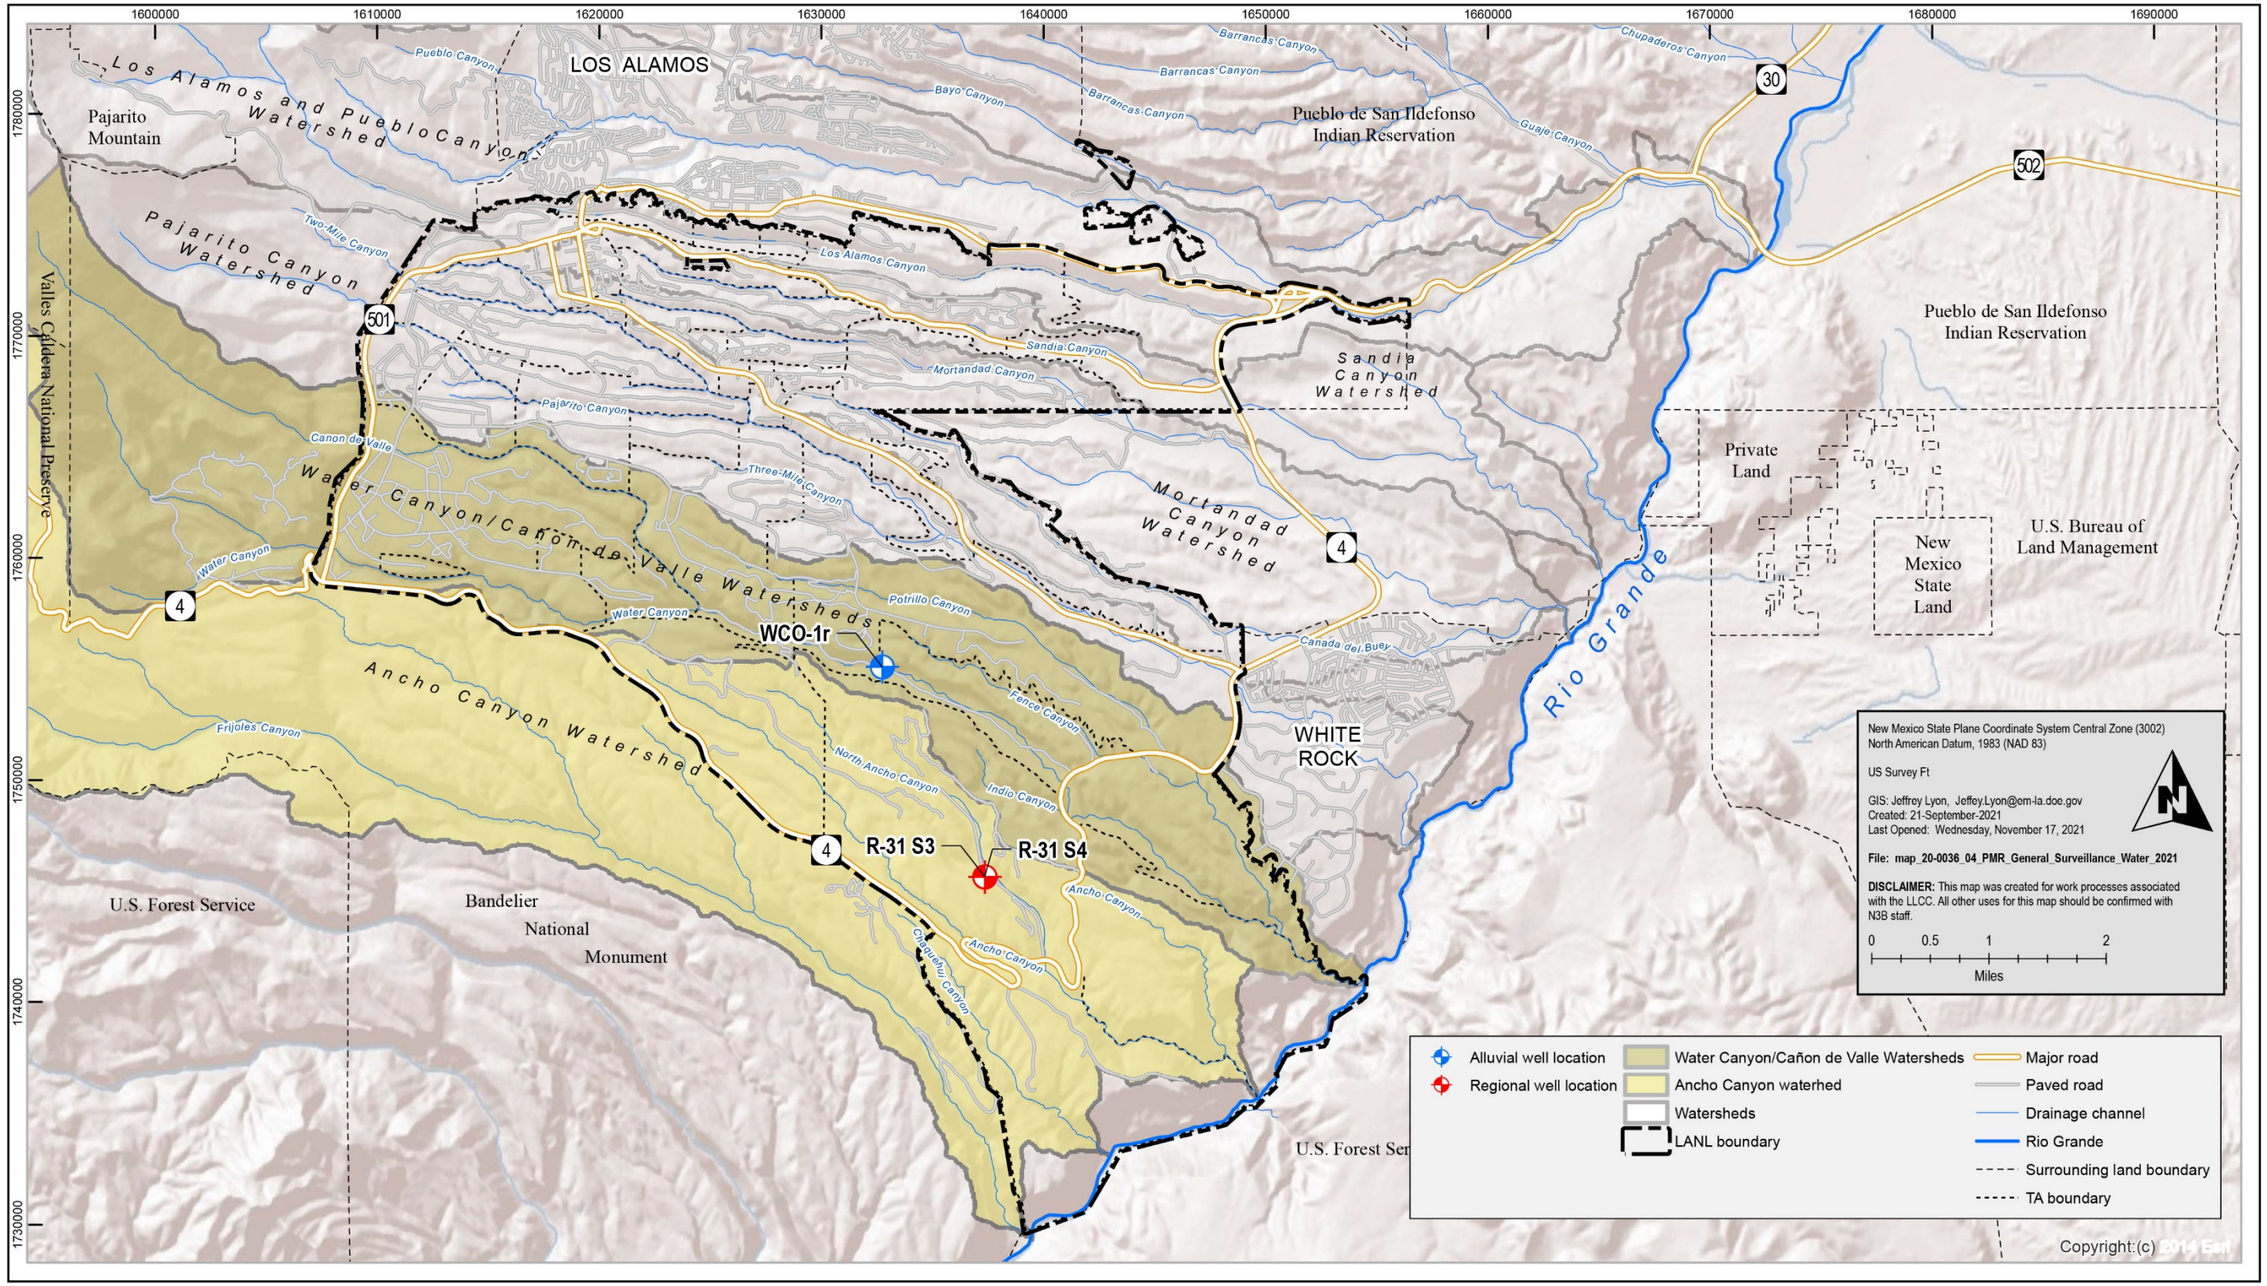

Figure 1.1-4 General Surveillance monitoring group locations in the Water Canyon/Cañon de Valle and Ancho Canyon watersheds

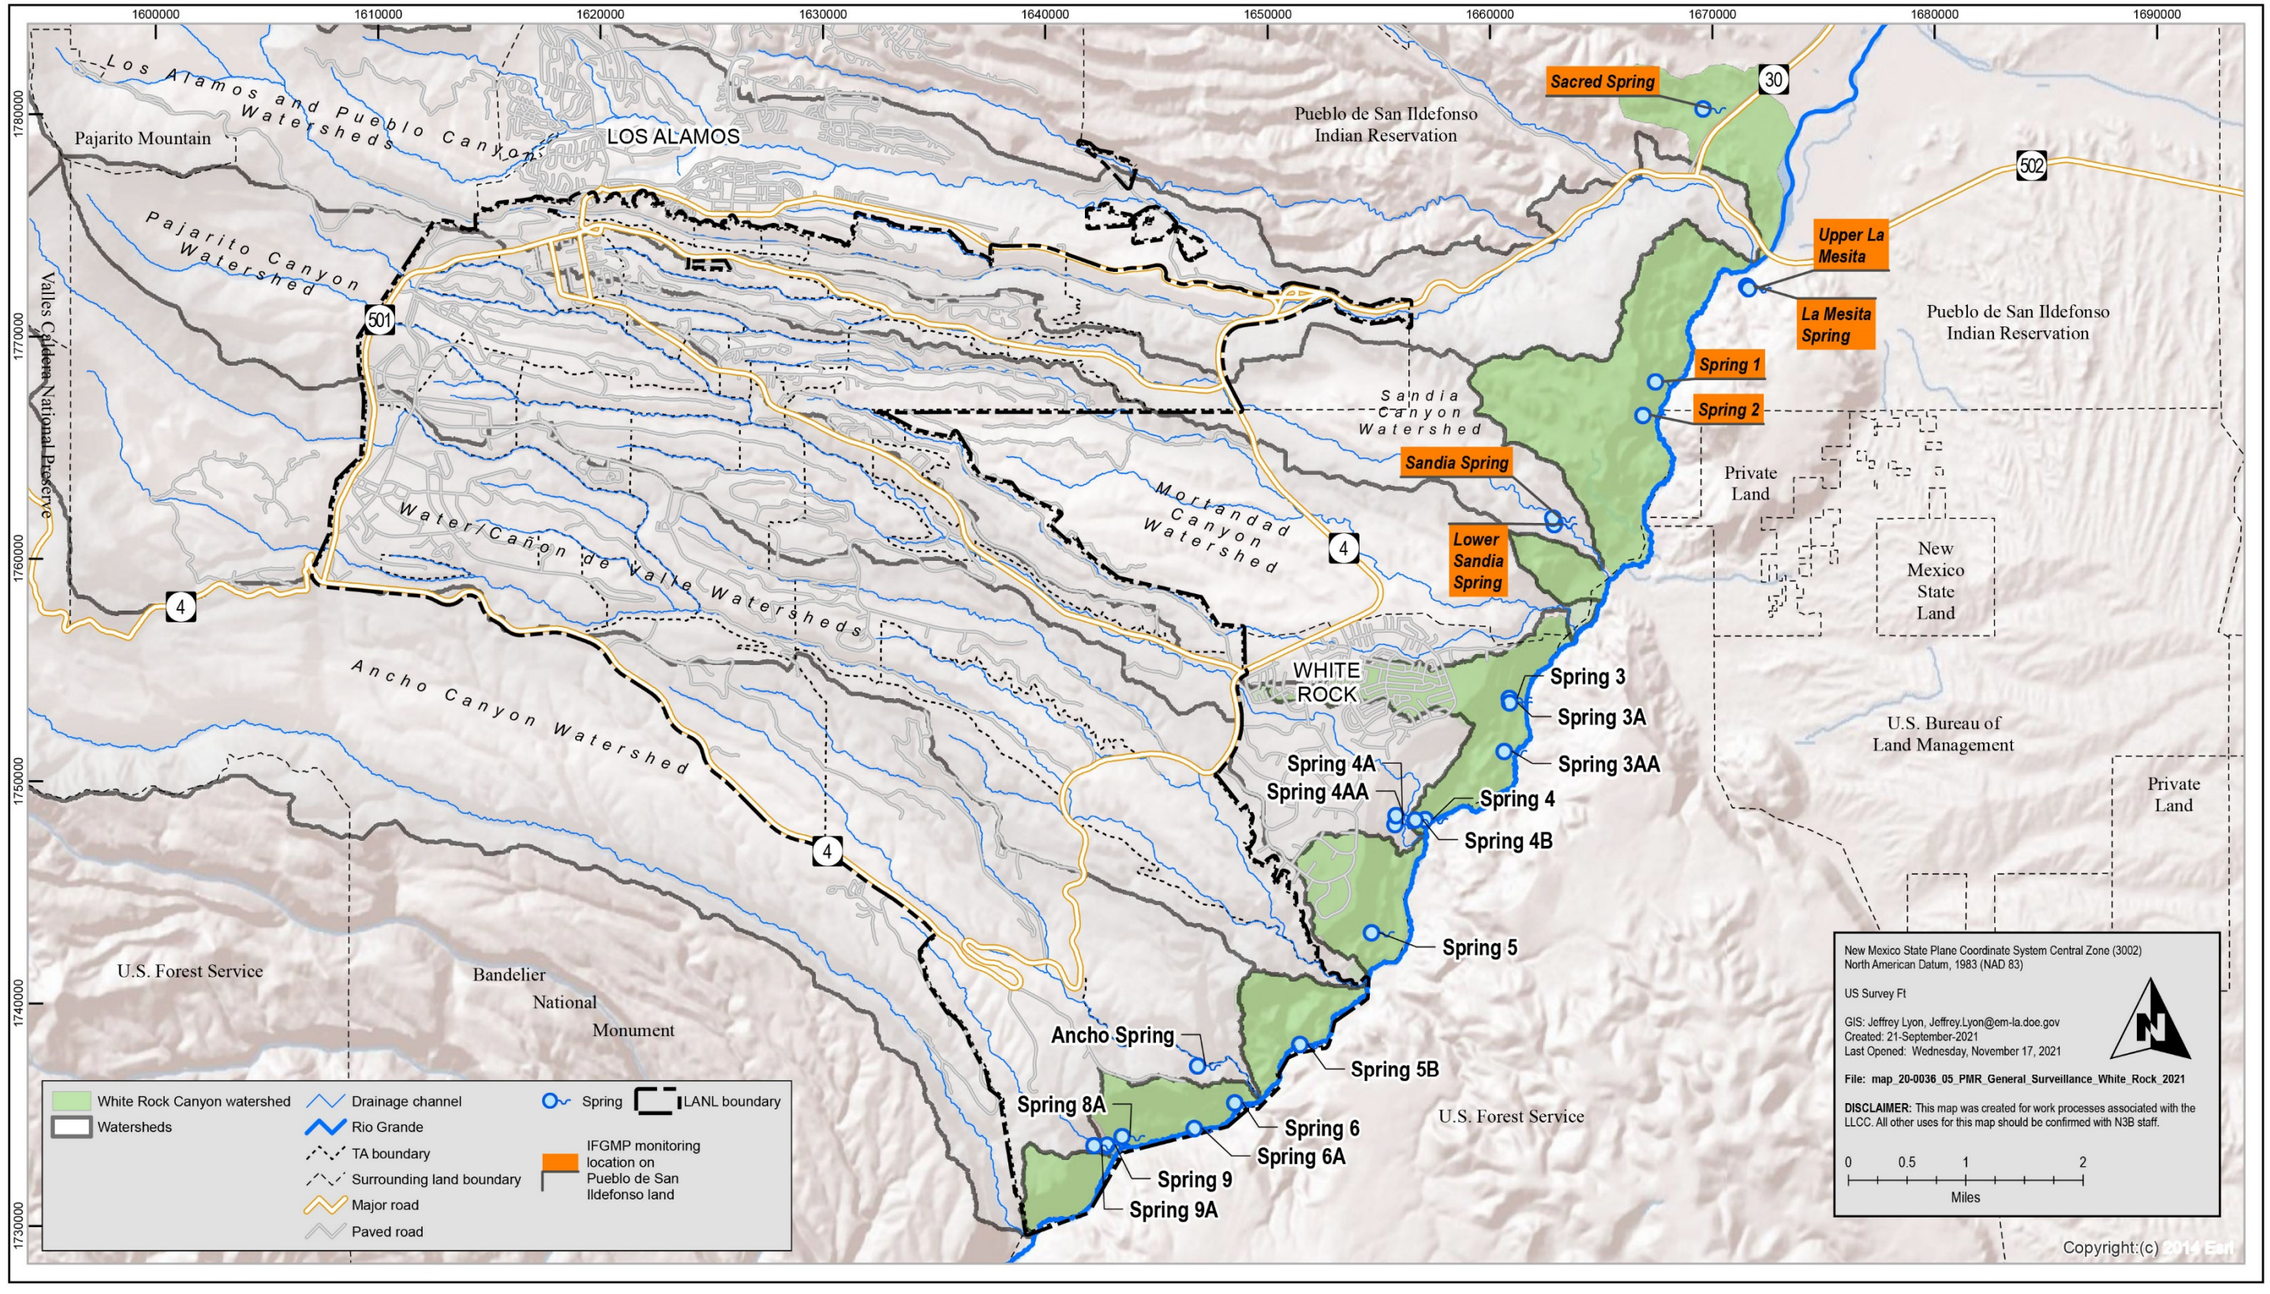

Figure 1.1-5 General Surveillance monitoring group locations in the White Rock Canyon watershed

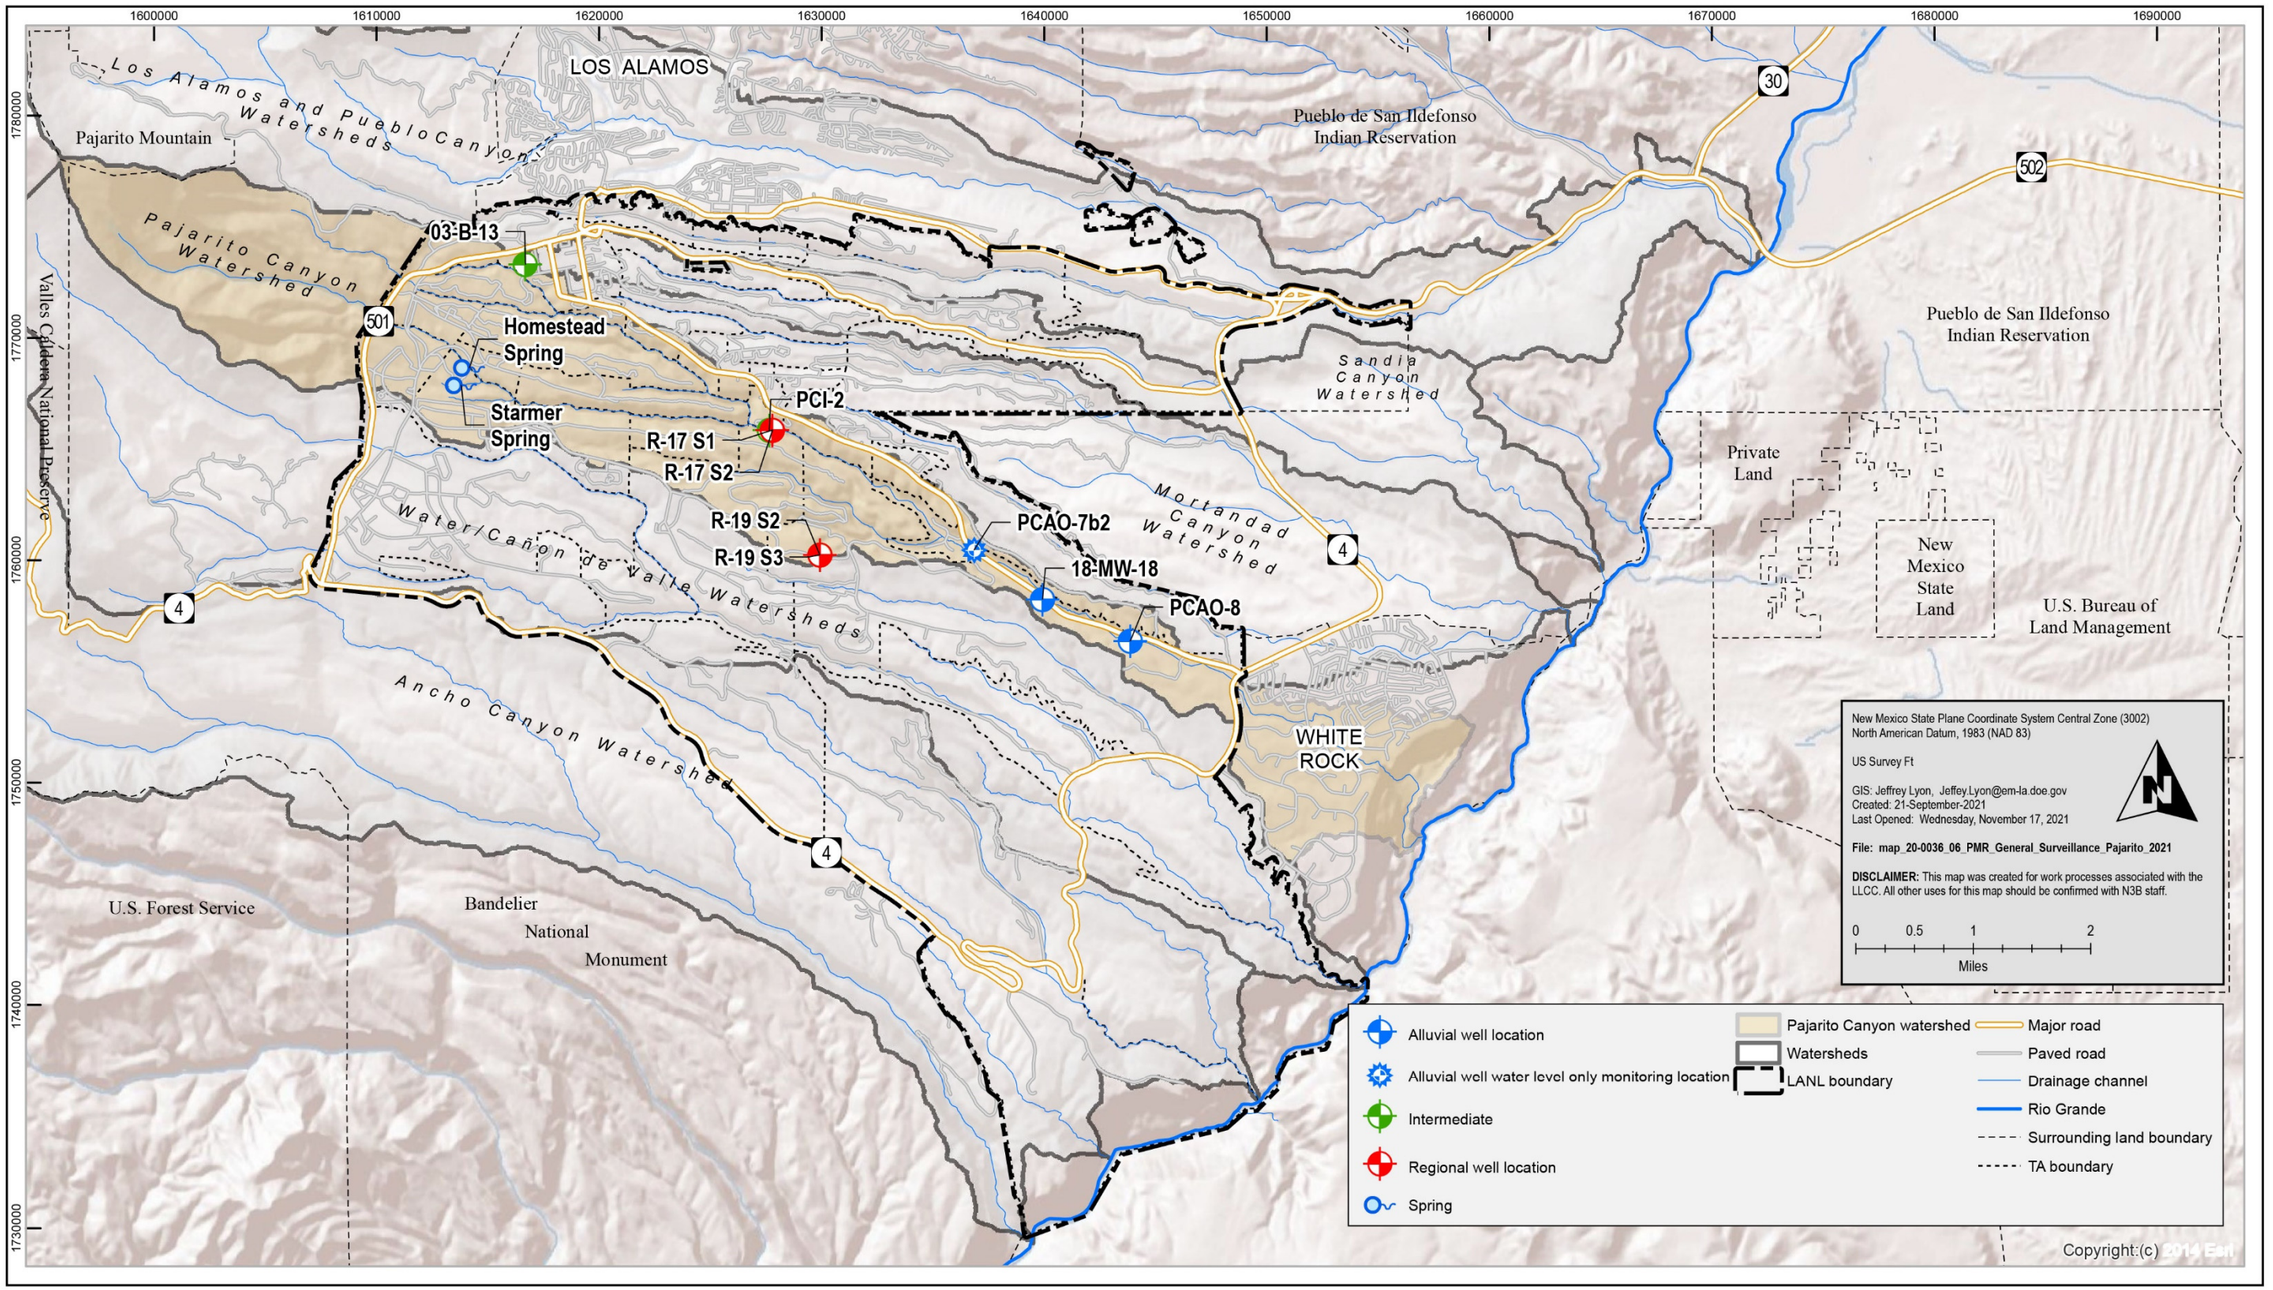

Figure 1.1-6 General Surveillance monitoring group locations in the Pajarito Canyon watershed

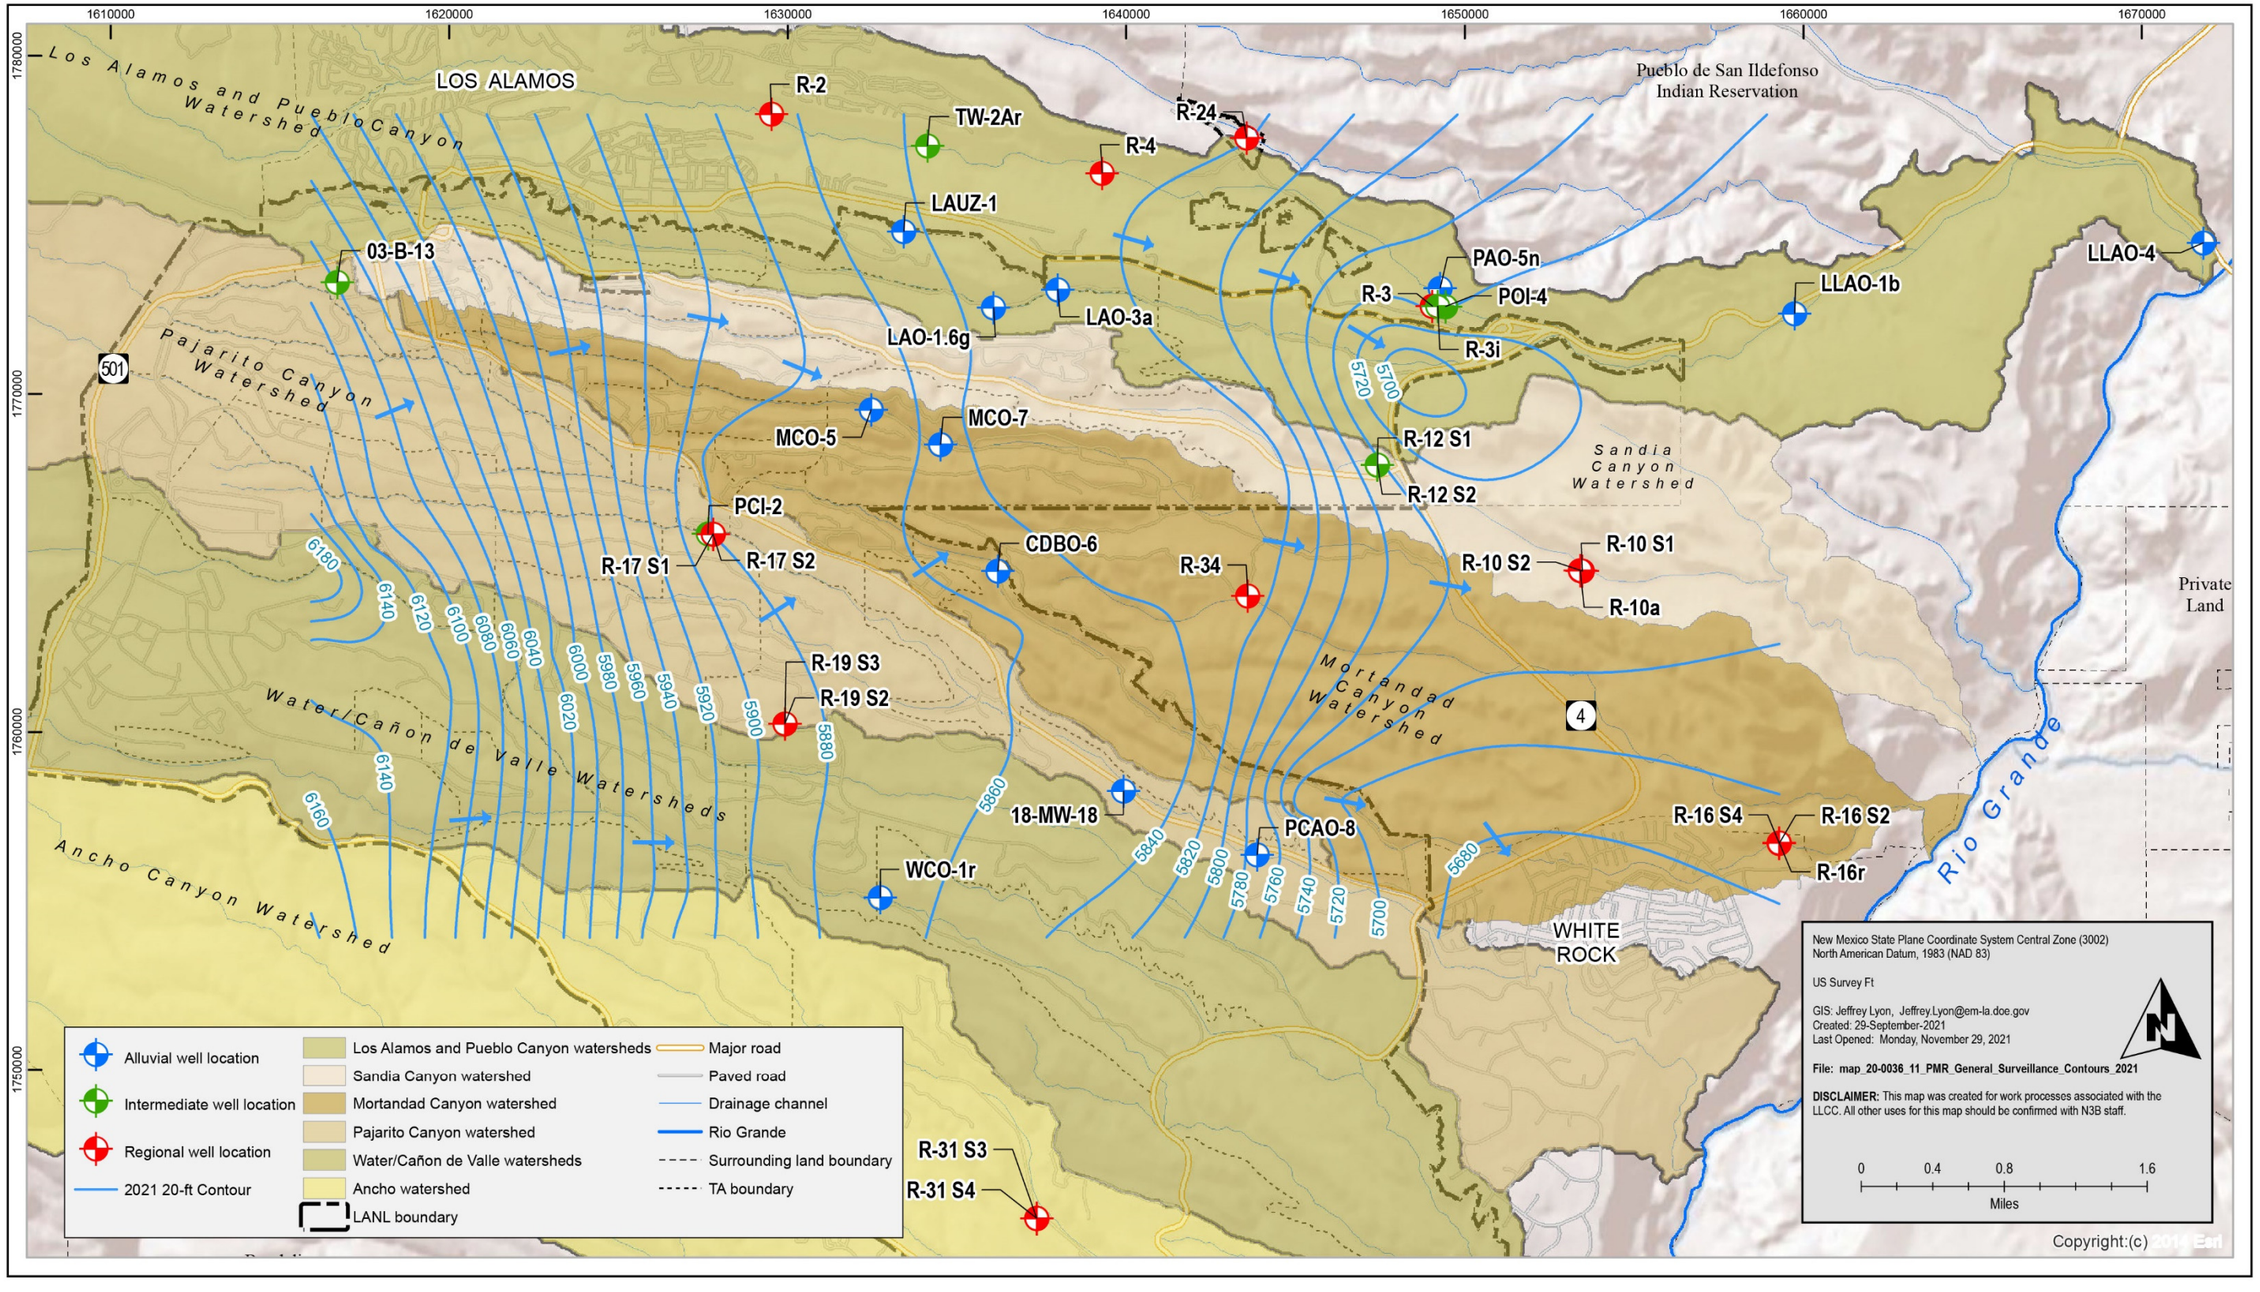
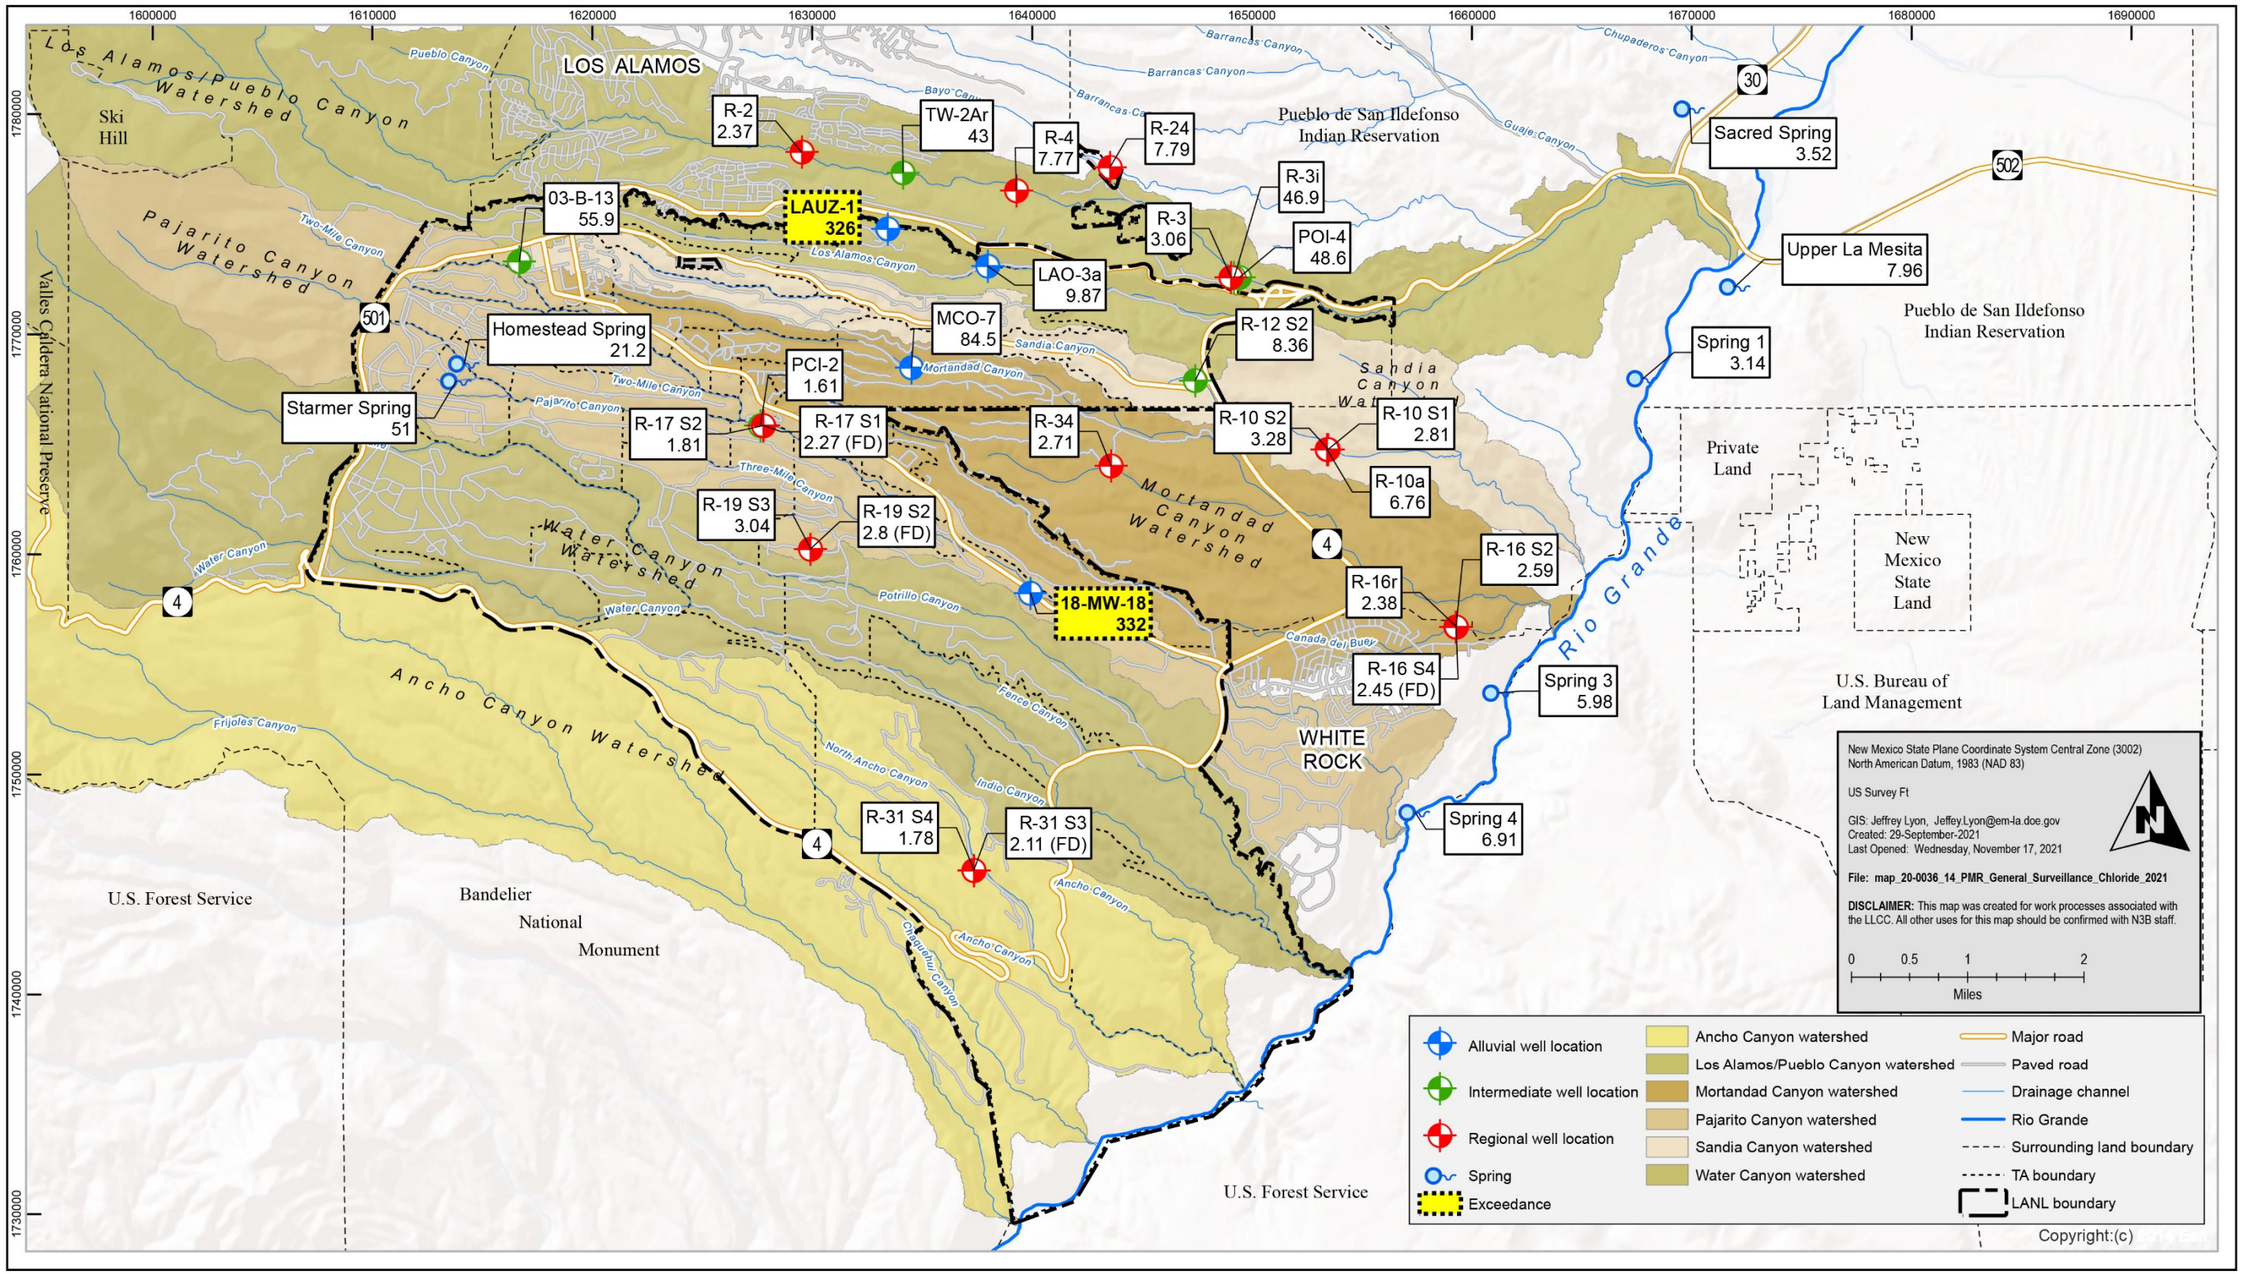


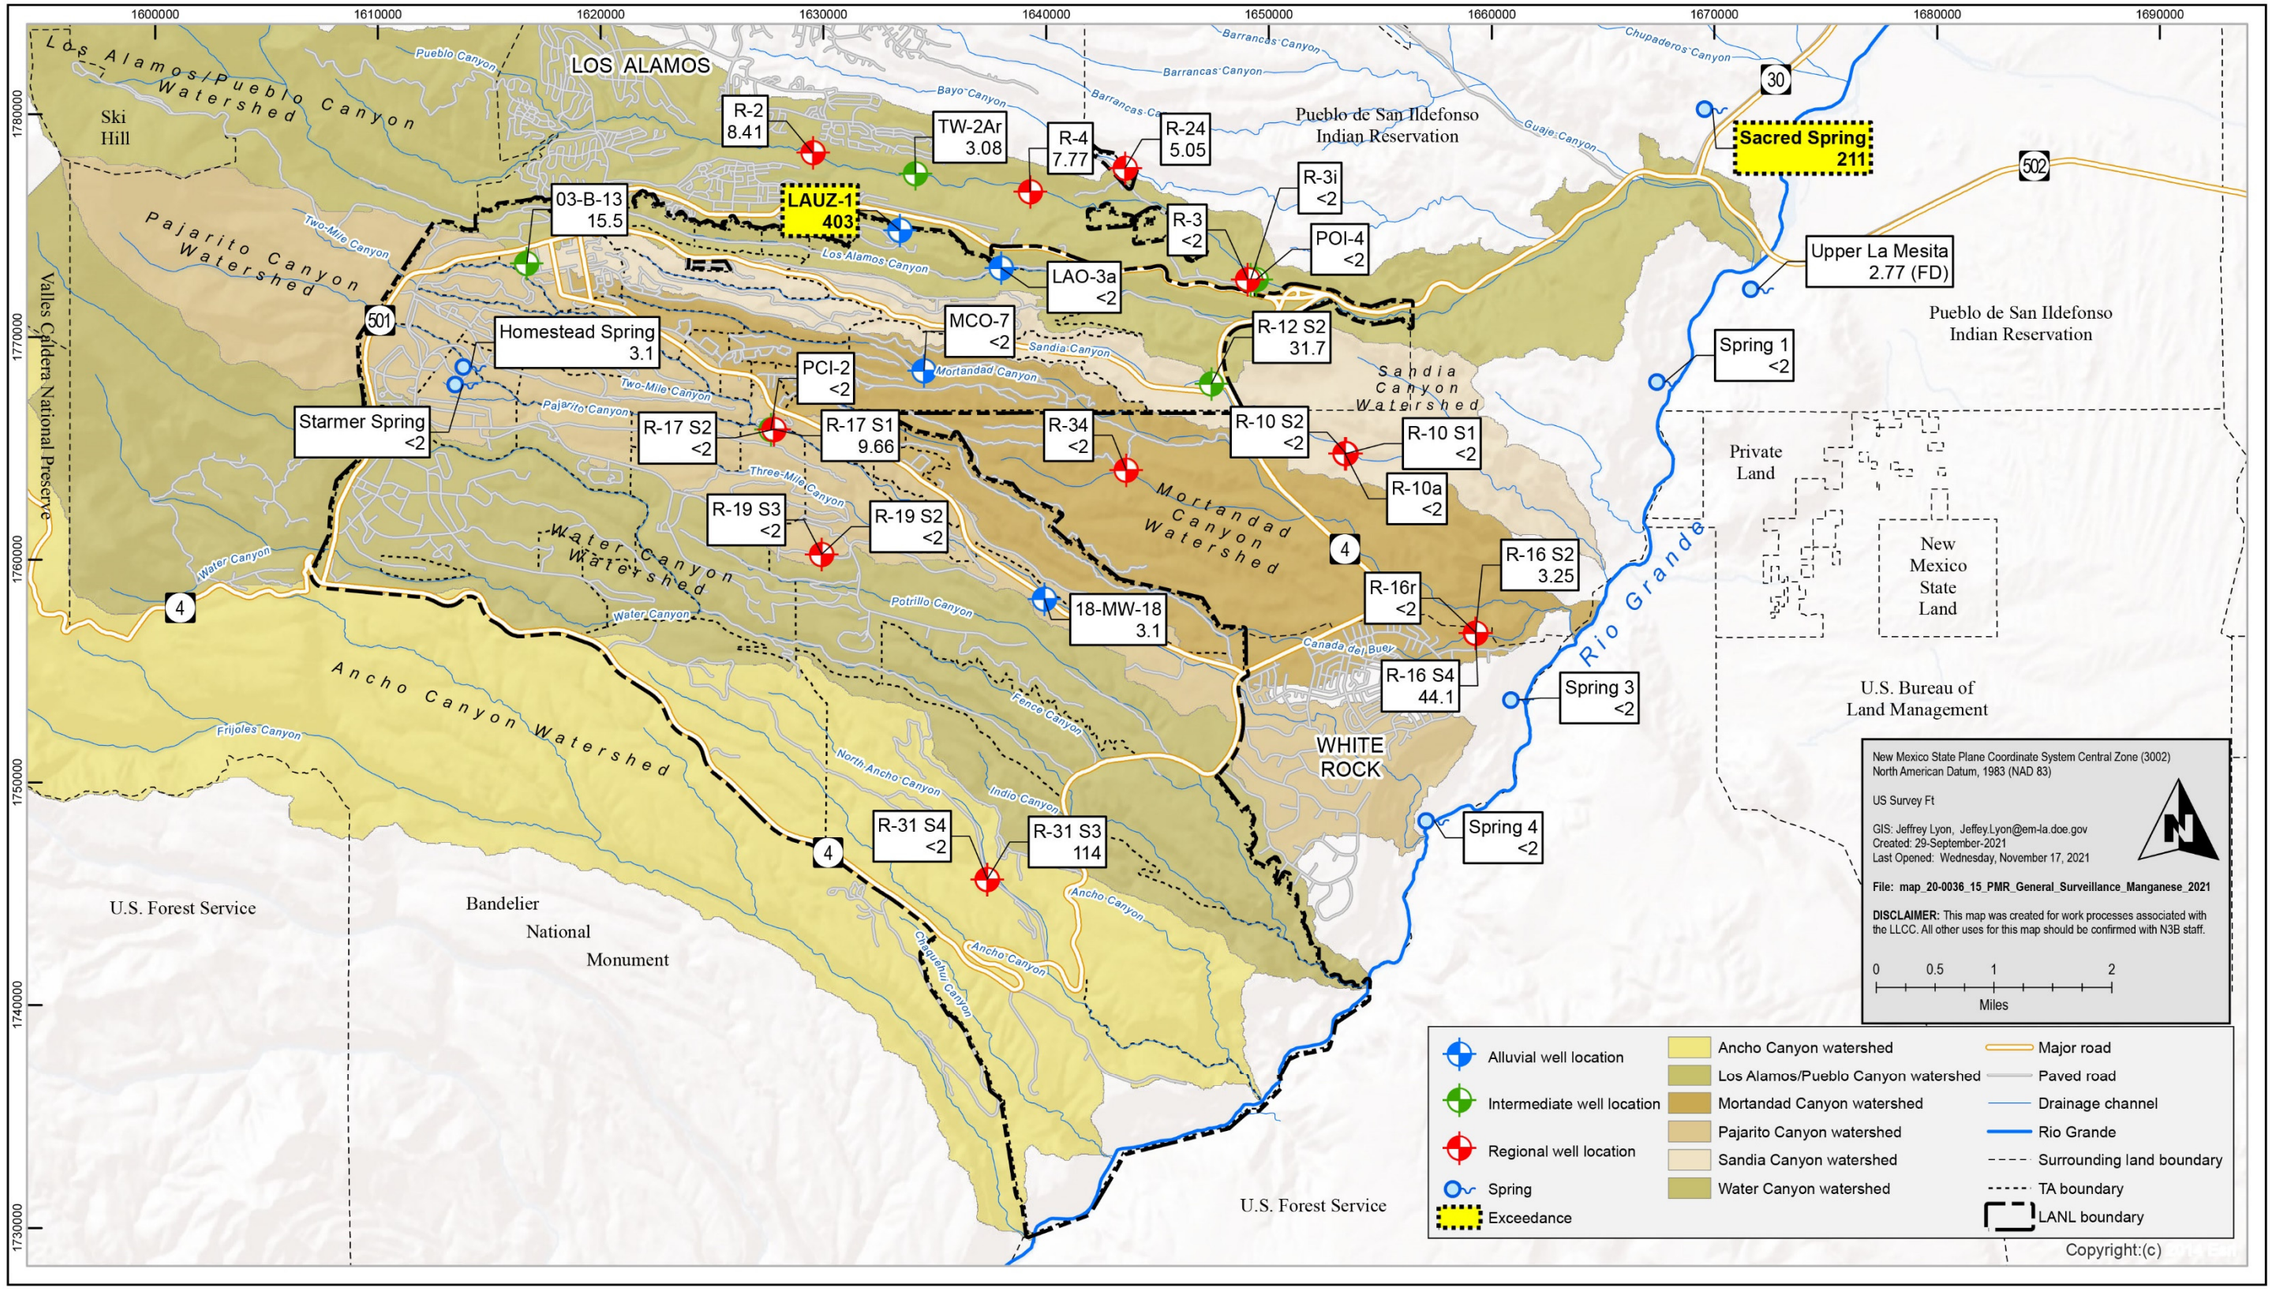
Note: Regional aquifer water table contours were generated with ArcGIS using the very first measurement on the first day of the periodic monitoring event presented in the PMR.

Figure 4.4-1 Regional aquifer water table map with flow direction



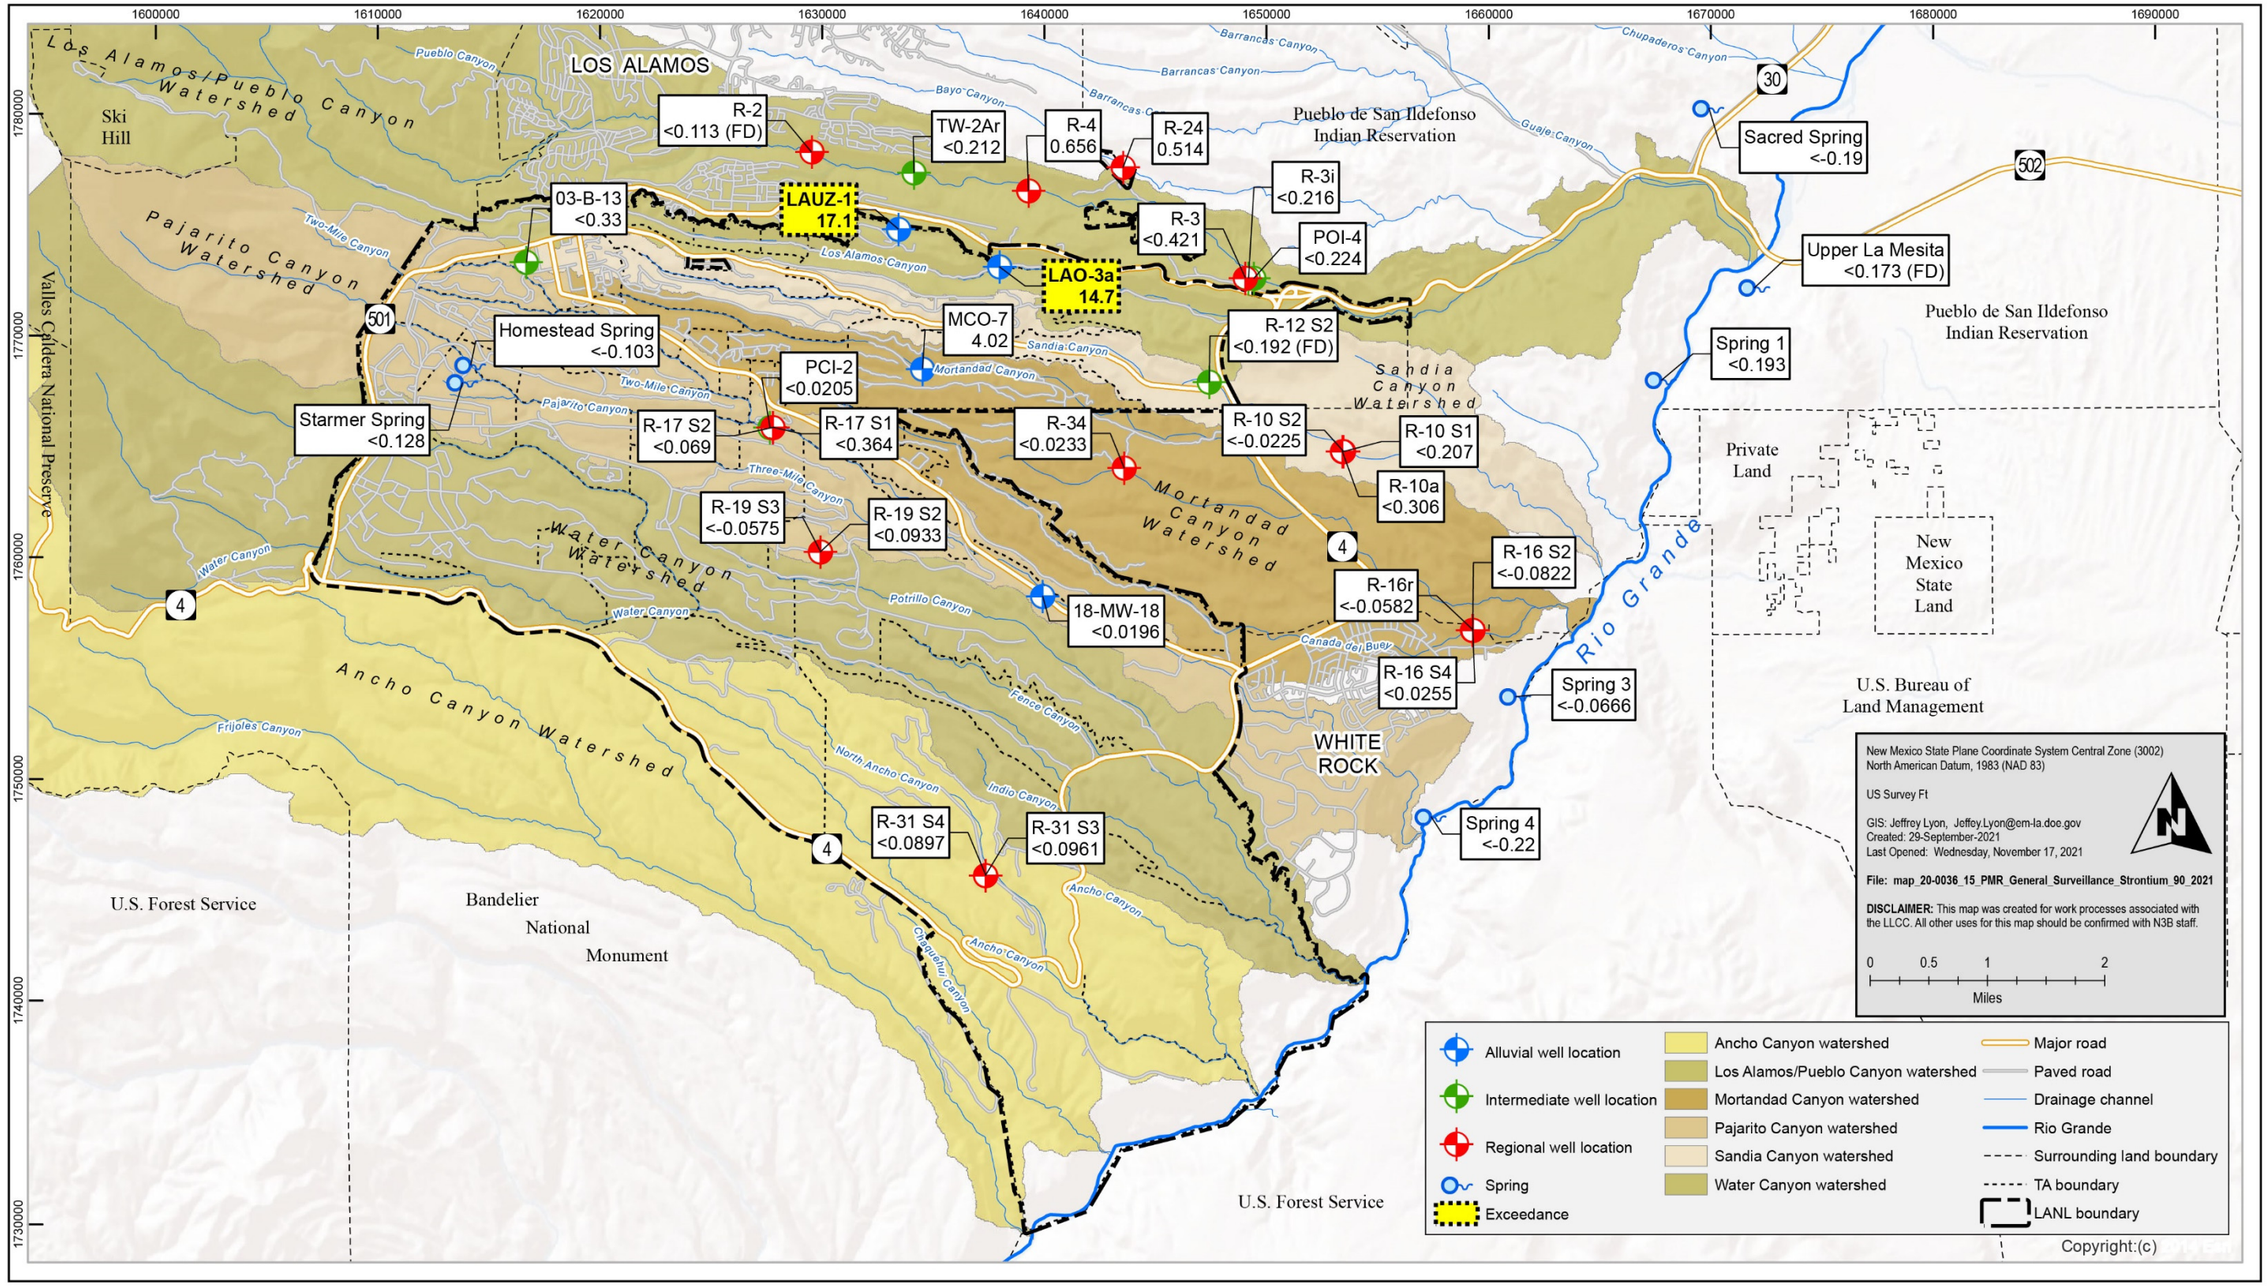
Note: The NMWQCC screening value for chloride in groundwater is 250 mg/L. The figure shows the highest concentration at each location during the PMEs reported in this PMR.

Figure 5.2-1 General Surveillance monitoring group filtered chloride concentrations in mg/L



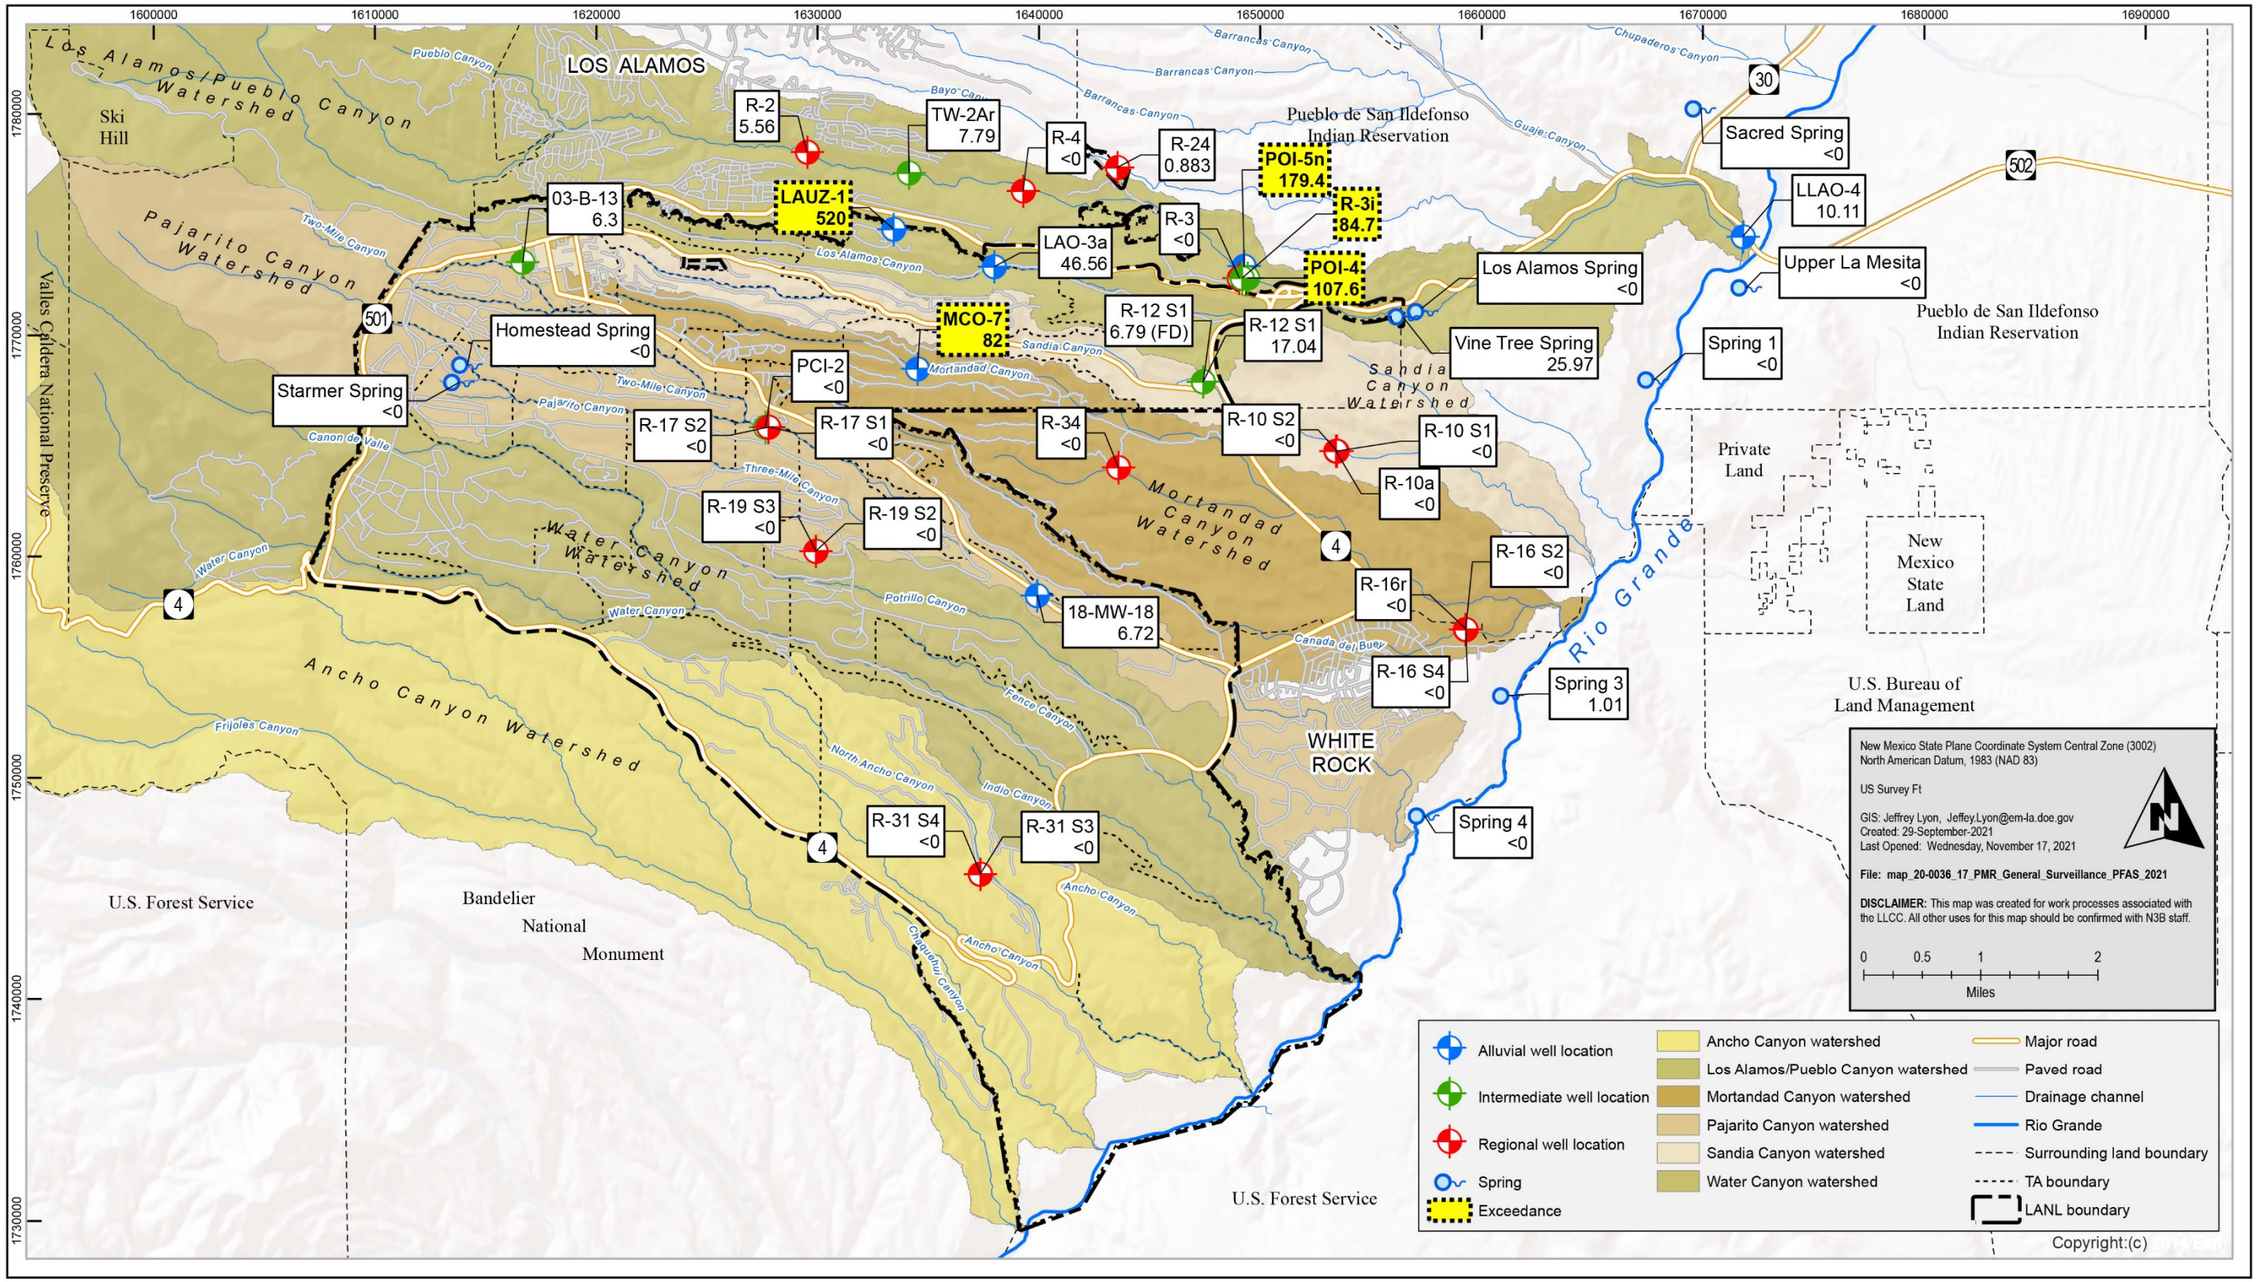
Note: The NMWQCC screening value for manganese in groundwater is 200 µg/L. The figure shows the highest concentration at each location during the PMEs reported in this PMR.

Figure 5.2-2 General Surveillance monitoring group filtered manganese concentrations in µg/L



Note: The EPA MCL screening value for strontium-90 in groundwater is 8 pCi/L. The figure shows the highest concentration at each location during the PMEs reported in this PMR.

Figure 5.2-3 General Surveillance monitoring group unfiltered strontium-90 concentrations in pCi/L.



Note: The NMED tap water screening value for total PFAS in groundwater is 70 ng/L. The figure shows the highest concentration at each location during the PMEs reported in this PMR.

Figure 5.2-4 General Surveillance monitoring group unfiltered total PFAS concentrations in ng/L

Monitoring Location	Watershed	Sampling Event		Deviation	Cause	Comment
		MY	Quarter			
LAO-1.6g	Los Alamos	2021 (cont.)	3 (cont.)	No field or analytical data will be available for this site.	Canceled: well is dry.	None
PCAO-8	Pajarito			No field or analytical data will be available for this site.	Canceled: water level was in sump.	None
PAO-5n	Pueblo			Limited analytical data will be available for this site.	Prioritized suite collected	A prioritized suite was collected because of limited available water.

S = Screen.

Table 3.0-1
Sources for Standards and Screening Levels for Groundwater at Los Alamos National Laboratory

Standard Type	Standard Source	Description	Groundwater
New Mexico			
Standard	20.6.2.3103 NMAC[a] (NMWQCC groundwater standard)	Groundwater Human Health Standards, other standards for domestic water supply and standards for irrigation use	X[b]
Screening Level	NMED	Tap water screening levels[c]	X
EPA			
Standard	40 Code of Federal Regulations 141	EPA MCLs[d]	X
Risk-Human	EPA generic screening levels	EPA generic screening levels for tap water[e]	X
DOE			
Standard	DOE Order 458.1	DOE 100-mrem public dose derived concentration technical standards[f]	X
Standard	DOE Order 458.1	DOE 4-mrem drinking water derived concentration technical standards[f]	X

[a] NMAC = New Mexico Administrative Code.

[b] X = Applied to data screen for this report.

[c] Screening levels derived from NMED guidance (NMED 2017, 602274; NMED 2019, 700550).

[d] EPA MCLs = EPA maximum contaminant levels (https://www.epa.gov/ground-water-and-drinking-water/national-primary-drinking-water-regulations).

[e] EPA generic screening levels (http://www.epa.gov/risk/risk-based-screening-table-generic-tables).

[f] DOE derived concentration technical standards (https://www.directives.doe.gov/directives-documents/400-series/0458.1-border-chg4-ltdchg).

Table 4.2-1 (continued)

Analyte Name	MDL	Analytical Method	Screening Value	Unit	Screening-Value Type	Lab ID
Dioxins and Furans						
Tetrachlorodibenzofuran[2,3,7,8-]	0.00000386–0.0000445	SW-846:8290A	0.00000184	µg/L	NMED A1 TAP SCRN LVL	CFA[g]

Note: This table is applicable to samples reported in this PMR and includes historical data statistics 10 years before the earliest start date in the PMR.

[a] NMED A1 TAP SCRN LVL = New Mexico Environment Department screening level for tap water.

[b] GELC = GEL Laboratories, LLC, Division of the GEL Group, Inc., Charleston, SC.

[c] EPA MCL = EPA maximum contaminant level (https://www.epa.gov/ground-water-and-drinking-water/national-primary-drinking-water-regulations).

[d] NM GW STD = New Mexico groundwater standard.

[e] SHEALY = Shealy Environmental Services, Inc., West Columbia, SC.

[f] EPA TAP SCRN LVL = U.S. Environmental Protection Agency screening level for tap water.

[g] CFA = Cape Fear Analytical, LLC, Wilmington, NC, Division of the GEL Group, Inc., Charleston, SC.

Table 4.2-2
Target Analytes with MDLs Below Screening Values

Analyte Name	MDL	Analytical Method	Screening Value	Unit	Screening Value Type	Lab ID
Semivolatile Organic Compounds						
Benzo(b)fluoranthene	0.3–0.37	SW-846:8270D	0.343	µg/L	NMED A1 TAP SCRN LVL[a]	GELC[b]
Chloroaniline[4-]	3.3–4.07	SW-846:8270D	3.7	µg/L	EPA TAP SCRN LVL[c]	GELC
Hexachloroethane	3.0–3.7	SW-846:8270D	3.28	µg/L	NMED A1 TAP SCRN LVL	GELC
Indeno(1,2,3-cd)pyrene	0.3–0.37	SW-846:8270D	0.343	µg/L	NMED A1 TAP SCRN LVL	GELC
Pentachlorobenzene	3.0–3.7	SW-846:8270D	3.07	µg/L	NMED A1 TAP SCRN LVL	GELC

Notes: This table is applicable to samples reported in this PMR and includes historical data statistics 10 years before the earliest start date in the PMR. For this table, the lower value of the MDL range is below the screening value, while the upper value is above the screening value.

[a] NMED A1 TAP SCRN LVL = New Mexico Environment Department screening level for tap water.

[b] GELC = GEL Laboratories, LLC, Division of the GEL Group, Inc., Charleston, SC.

[c] EPA TAP SCRN LVL = U.S. Environmental Protection Agency screening level for tap water.

[a] WG = Groundwater.

[b] gpm = Gallons per minute.

[c] SU = Standard unit.

[d] NTU = Nephelometric turbidity unit.

[e] — = Not applicable. Missing field measurement record numbers were not assigned for flow, dissolved oxygen, pH, specific conductance, temperature, or turbidity field parameters at this location. Data are from the field notes.
