Subject: Submittal of the Quarterly Report for the Discharge of Treated Groundwater to the Regional Aquifer under Discharge Permit 1835, Calendar Year 2022 Quarter 4, Class V Underground Injection Control Wells

Dear Mr. Ball:

On August 31, 2016, the New Mexico Environment Department (NMED) issued Discharge Permit 1835 (DP-1835) to the U.S. Department of Energy (DOE) and Los Alamos National Security, LLC (LANS) for the discharge of treated groundwater to the regional aquifer from up to six Class V underground injection control (UIC) wells. On July 21, 2017, NMED approved minor updates to DP-1835. During the second quarter of calendar year (CY) 2018, ownership of the discharge permit transferred from LANS to Newport News Nuclear BWXT-Los Alamos, LLC (N3B). Pursuant to Condition Number 10 of the above-referenced discharge permit, DOE/N3B are required to submit quarterly reports to document the following:

1. influent and discharge volumes from the treatment systems,
2. quarterly groundwater and treated effluent sampling results, and
3. operations and maintenance activities.

Pursuant to Condition Numbers No. 11, 12, and 13 of DP-1835, the quarterly reports shall also contain general information, performance information, and monitoring data for treated effluent from each ion exchange treatment system. Condition Number 10 requires submission of a quarterly report to NMED by March 1, 2023, for the October 1 through December 30, 2022, discharge period.

During the CY 2022 Quarter 4 reporting period for DP-1835, discharge of treated groundwater to the regional aquifer occurred at five UIC wells: CrIN-1 through CrIN-5. Groundwater originated predominantly from five extraction wells: CrEX-1 through CrEX-5. In November 2022, the extraction and discharge was reduced to two extraction wells, CrEX-4 and CrEX-5, and two UIC wells, CrIN-4 and CrIN-5. The groundwater was treated by chromium treatment unit A (CTUA) and chromium treatment unit C (CTUC) before injection at the UIC wells.

The enclosed “Quarterly Report for the Discharge of Treated Groundwater to the Regional Aquifer under Discharge Permit 1835, Calendar Year 2022 Quarter 4,” provides the information required under DP-1835 for this reporting period.

If you have questions, please contact Christian Maupin at (505) 695-4281 (christian.maupin@em-la.doe.gov) or Cheryl Rodriguez at (505) 414-0450 (cheryl.rodriguez@em.doe.gov).

Sincerely,

Robert Macfarlane

1.0 INTRODUCTION

On August 31, 2016, the New Mexico Environment Department (NMED) issued Discharge Permit 1835 (DP-1835) to the U.S. Department of Energy (DOE) and Los Alamos National Security, LLC (LANS) for the discharge of treated groundwater to the regional aquifer through Class V underground injection control (UIC) wells. On July 21, 2017, NMED approved minor updates to DP-1835. During Quarter 4 of calendar year (CY) 2018, ownership of the discharge permit transferred from LANS to Newport News Nuclear BWXT-Los Alamos, LLC (N3B).

During the calendar year (CY) 2022 Quarter 4 reporting period for DP-1835, groundwater was extracted for treatment from five extraction wells, CrEX-1 through CrEX-5. The groundwater was treated by ion exchange (IX) in Chromium Treatment Unit A (CTUA) and Chromium Treatment Unit C (CTUC). Discharge of treated groundwater to the regional aquifer occurred at five UIC wells, CrIN-1 through CrIN-5. In November 2022, the extraction and discharge was reduced to two extraction wells, CrEX-4 and CrEX-5, and two UIC wells, CrIN-4 and CrIN-5.

Condition No. 10 of DP-1835 requires submission of a quarterly report to NMED by March 1 for the October 1 through December 30 discharge period. Several conditions within the permit identify information to be submitted in the quarterly report. These conditions are addressed in this report in the following requirements:

1. Influent and discharge volumes for the IX treatment systems (Condition No. 10)
2. Quarterly treated-effluent sampling results from each IX treatment system (Conditions No. 10 and 13)
3. Quarterly depth-to-groundwater and groundwater-quality sampling results (Conditions No. 10 and 14)
4. Any operations/maintenance activities performed (Condition No. 10)
5. Any periodic test of mechanical integrity conducted (Condition No. 11.a)
6. Any replacement of primary or secondary IX vessels or associated treatment system infrastructure (Condition No. 11.b)
7. Any well workovers conducted (Condition No. 11.c)
8. Any additional operational changes with the potential to markedly affect the discharge (Condition No. 11.d)
9. Monthly average, maximum, and minimum values for flow rate and volume of treated effluent transferred to each UIC well (Condition No. 12.a)
10. Total monthly volume of treated effluent transferred to each UIC well (Condition No. 12.b)
11. Monthly average, maximum, and minimum values of injection water level (pressure head) above static level for each UIC well (Condition No. 12.c)
12. Daily volume injected at each UIC well (Condition No. 12.d)
13. Daily volume pumped from each extraction well (Condition No. 12.e)
14. Facility layout map (Condition No. 14)
15. Groundwater elevation contour map (Condition No. 15)

This report addresses each of these requirements.

2.0 REQUIREMENTS

2.1 Influent and Discharge Volumes for the Ion-Exchange Treatment Systems (Requirement 1)

Table 2.1-1 provides the total influent volume to the IX system, and the discharge volumes from IX treatment systems CTUA and CTUC, during CY 2022 Quarter 4 for activities completed under DP-1835.

**Table 2.1-1
Total Influent and Discharge Volumes
for IX Treatment Systems – CY 2022 Quarter 4, DP-1835**

Treatment Unit	Influent Volume ^a (gal.)	Effluent Volume ^b (gal.)
CTUA	23,938,509	18,364,092
CTUC		5,579,737

Note: Individual flow meter accurate to ±5%.

^a Influent volume based on CrEX-1 through CrEX-5 extraction volumes.

^b Effluent volume based on CTUA and CTUC flow-meter readings.

2.2 Quarterly Treated Effluent Sampling Results from Each Ion-Exchange Treatment System (Requirement 2)

Analytical results from samples of treated effluent collected during CY 2022 Quarter 4 for activities completed under DP-1835 are summarized in Table 2.2-1. No sample results for total chromium, nitrate, perchlorate, sulfate, fluoride, chloride, or total dissolved solids exceeded 90% of the numeric standards of 20.6.2.3103 New Mexico Administrative Code (NMAC) or, for constituents not listed in 20.6.2.3103 NMAC, 90% of the numeric screening levels established for tap water in Table A-1 of the 2022 NMED “Risk Assessment Guidance for Site Investigations and Remediation Volume 1, Soil Screening Guidance for Human Health Risk Assessments” (NMED 2022). The values representing 90% of the applicable standards or screening levels for these seven analytes are:

- Chloride 225 mg/L
- Chromium 45 µg/L
- Fluoride 1.44 mg/L
- Nitrate 9 mg/L
- Perchlorate 12.4 µg/L
- Sulfate 540 mg/L
- Total dissolved solids 900 mg/L

^a In accordance with Condition No. 13 of DP-1835, analysis of the treated effluent from each IX unit is required only once every month for the CY 2022 Quarter 4 reporting period.

^b n/a = Not applicable: no qualifiers applied.

^c In the Detect Flag column, Y = detected.

^d In the Filtered column, Y = filtered.

^e U = Analyte is classified as not detected.

^f N = No (not detected).

^g J = Analyte is classified as estimated.

The pilot-scale molasses and sodium dithionite amendment studies, that began with NMED conditional approvals during CY 2017 Quarter 4 (NMED 2017a, NMED 2017b), continued during CY 2022 Quarter 4. NMED determined that no permit was required for the deployment of these amendments. In accordance with the NMED conditional approvals, iron, manganese, and arsenic sampling in the treated water from extraction wells was completed, and the results were submitted in the quarterly monitoring reports under DP-1835. These results for CY 2022 Quarter 4 are provided in Table 2.2-2. No results for iron, manganese, or arsenic exceeded 90% of the numeric standards (900 µg/L, 180 µg/L, and 9 µg/L, respectively) as specified in 20.6.2.3103 NMAC.

2.3 Quarterly Depth to Groundwater and Groundwater Quality Sampling Results (Requirement 3)

Depth to groundwater is expressed as the elevation of the groundwater above sea level. Figure 2.3-1 is the groundwater elevation map, and Table 2.3-1 provides the quarterly groundwater elevation measurements for a non-exhaustive selection of wells. An explanation of how the groundwater elevation map was generated is provided below. Quarterly groundwater analytical results from samples collected during CY 2022 Quarter 4 for the monitoring wells listed in Condition No. 14 are summarized in Table 2.3-2. Note that some analytes reported in this table exceed their corresponding groundwater standard or screening level.

Sample results for total chromium, nitrate, perchlorate, sulfate, fluoride, chloride, and total dissolved solids are compared with numeric standards of 20.6.2.3103 NMAC or, for constituents not listed in 20.6.2.3103 NMAC, the numeric screening levels established for tap water in Table A-1 of the 2022 NMED “Risk Assessment Guidance for Site Investigations and Remediation Volume 1, Soil Screening Guidance for Human Health Risk Assessments” (NMED 2022). The values of the applicable standards or screening levels for these seven analytes are:

- Chloride 250 mg/L
- Perchlorate 13.8 µg/L
- Chromium 50 µg/L
- Fluoride 1.6 mg/L
- Nitrate 10 mg/L
- Sulfate 600 mg/L
- Total dissolved solids 1000 mg/L

The regional aquifer beneath the Pajarito Plateau, on which Los Alamos National Laboratory (LANL or the Laboratory) is situated, is a complex hydrogeological system. The shape of the regional water table is predominantly controlled by the areas of recharge to the west (the flanks of the Sierra de los Valles and the Pajarito fault zone) and discharge to the east (the Rio Grande and the White Rock Canyon Springs). At a more local scale, such as the chromium plume area, the structure of the regional water table and groundwater flow is also expected to be influenced by

- local infiltration zones and recharge areas (e.g., beneath canyons),
- heterogeneity and anisotropy in the aquifer properties, and
- extraction and injection locations (municipal water-supply wells and chromium interim measure [IM] extraction/injection wells).

^c N = No (not detected).

^d In the Filtered column, Y = filtered.

^e J = Analyte is classified as estimated.

^f In the Detect Flag column, Y = detected.

^g n/a = Not applicable: no qualifiers applied.

R-61 S2	5831.41
R-62	5833.59
SIMR-2 ^e	na

^a Groundwater elevations provided are based on average November 2022 values from transducers.

^b S1 = Screen 1.

^c S2 = Screen 2.

^d na = data were not available in November 2022

^e SIMR-2 data are reported here in accordance with the memorandum of agreement and protocol agreement between San Ildefonso Pueblo and DOE.

^d In the Filtered column, N = not filtered.

^e U =Analyte is classified as not detected.

^f In the Detect Flag column, N = not detected.

^g J = Analyte is classified as estimated.

^h S1 = Screen 1.

ⁱ S2 = Screen 2.

Long-term water-level data, contaminant transport observations (travel times and direction of migration), and calibrated model results suggest that the water table was relatively flat in the area of the chromium plume before the implementation of CrEX extraction and CrIN injection wells. Steeper gradients are found to the west because of the mountain-front recharge and to the east toward the Rio Grande. The low ambient gradient in the chromium plume area could be related to any or all of the following:

- the relatively high permeability of the Puye Formation and Miocene pumiceous sediments
- anisotropy of the regional aquifer
- localized recharge along the canyons above the regional aquifer, faults, or other lineaments that affect regional-scale hydraulic conductivity
- nearby water-supply pumping

Although it is difficult to infer absolute groundwater flow directions from the relatively flat contours in the chromium plume area, the general flow of groundwater can be determined. Groundwater elevation data and contaminant transport observations indicated that, before operation of the IM, the groundwater flowed generally toward the east-southeast. The current groundwater flows generally toward the southeast, with the influence of IM operations being seen mainly in the vicinity of the extraction wells CrEX-1, CrEX-2, CrEX-3, and CrEX-4. Local flow direction near these wells is inward because of the extraction-induced depression in potentiometric surface.

Water-table elevations in the chromium plume area can vary temporally as a result of transient effects that include injection into, and extraction from, the chromium IM infrastructure wells, and pumping of Los Alamos County's water-supply wells. This is discussed for the case of CY 2022 Quarter 4 below.

In the chromium plume area, effects on flow direction from water-supply pumping are small compared with the local effects of extraction and injection at chromium IM wells. Transience in the water levels at time scales of hours to days observed at the monitoring wells within the plume area does not appear to be substantially affected by the water-supply pumping at the nearby production wells (PM-2, PM-3, PM-4, PM-5, and O-4) (LANL 2009). Impacts of production well pumping are observed over seasonal to yearly time scales and overall have led to a fairly uniform decline in the water table across the plume area, in contrast to IM extraction and injection impacts.

A long-term decline of approximately 0.2 to 0.5 ft/yr in the regional water levels has been observed throughout the aquifer beneath the Pajarito Plateau. The decline could be caused by long-term changes in the aquifer recharge and discharge conditions. Because of the long-term declines and pumping transience described above, the water-level data and the respective water table contour maps are variable over time; each map therefore represents a specific period of time. Figure 2.3-1 depicts the average water-level data and water table contours for November 2022. General flow direction is indicated by the vector.

To generate this quarterly contour map, average water levels are calculated with a default of using values from the middle month of the 3-month reporting period. In quarters where the middle month may not be representative (e.g., due to an IM well pumping hiatus), water-level values from times other than the middle month are selected. Monitoring wells within and surrounding the plume are used, including wells not presented on the map (e.g., R-21, R-31, R-32, R-37, and R-40) or in Table 2.3-1. Water levels in wells surrounding the plume provide useful control points for contouring along the edges of the area of interest for this report.

Simple interpolation methods for water table data from a complex heterogeneous site could produce maps that do not represent physically realistic hydrological systems. This water table map is contoured by incorporating process knowledge of groundwater hydraulics (e.g., flownet conformity rules) as well as conceptual models of groundwater flow in the project area as described above. Key inputs to the conceptual model include knowledge of long-term operations of extraction and injection wells, water-level elevations in monitoring wells near extraction and injection points, and cross-hole tracer data between injection wells and monitoring wells.

In 2018 and 2019, water table maps for DP-1835 were generated using an interpolation method called thin-plate spline (TPS) (e.g., <https://www.jstor.org/stable/2241837>). TPS is a special case of universal kriging. In 2020, an interpolation method called Bayesian canonical correlation regression (BCCR) (Carson 2020) was implemented. BCCR increased efficiency of map-making by using prior knowledge of water levels to generate an initial water table map of the expected surface given quarterly water levels. Kriging was then used to update the map using residuals between the water levels and the expected surface for a given quarter. In CY 2022 Quarter 4, the interpolation method used reverted to TPS. This change was made because of the greater representation of TPS in the scientific literature. Maps generated with the two methods are analogous because both methods use kriging-based interpolation; the primary difference between the two methods is the incorporation of prior information as an initial estimate of water levels.

Because of the spatial coverage of wells and piezometers and the regional structure of significantly steeper gradients to the east and west of the chromium plume area, the surrounding wells (e.g., R-21, R-31, R-32, R-37, and R-40) and control points based on expert opinion are used to provide estimated water-level elevations in areas that do not have sufficient data to provide constraints (EPA 2008). As additional analysis is performed using historical and developing data sets from existing wells and data that will be collected from proposed wells, the use of these control points is being reanalyzed, adjusted, or discontinued based on additional supporting data and contouring methods.

Over the course of operating the chromium IM system, changes to water table elevation occur depending upon how the system has been operating. A quarter-by-quarter account of the water table elevations is not provided as part of this quarterly report. Each quarterly report previously submitted provides information of the water table elevation near the chromium IM wells along with possible causes for water-level variations for that specific quarter. Information on the quarterly depth to groundwater for CY 2022 Quarter 4 is provided in Figure 2.3-1 and Table 2.3-1.

In the current reporting period of CY 2022 Quarter 4, IM pumping was generally consistent through October. Near the end of October, extraction ceased at IM extraction wells CrEX-1, -2, and -3 due to grounding failures, and injection ceased at injection wells CrIN-1, -2, and -3 to maintain flow balance. Data availability was hindered by equipment breakages or scheduled maintenance; notably, data from R-44, R-45, R-70, and SIMR-2 were not available in 2022 Q4.

Therefore, Figure 2.3-1 should be interpreted cautiously, especially in the central regions where R-42 is located. On previous maps, the contour in the middle of the chromium plume area was closed, meaning water could not flow out. The open contour on the current map may be linked to lack of water-level data. For example, data from R-42 would assist in interpreting trends in the central area of the map where water levels are below 5829 ft. Also, care should be employed in the interpretation of the southeast area of the map where SIMR-2 is located (not plotted in Figure 2.3-1 due to lack of data).

However, comparisons with prior quarters indicate a strong influence of the IM wells, notably in the lack of a closed water-level contour in the central area, and in water levels associated with specific wells. For example, the CrPZ-1 water level increased by 2.8 ft between 2022 Q3 and Q4. This is a considerable

change over one quarter for the area of the chromium plume. The increase appears linked to the pause in extraction at CrEX-2. The pause in IM pumping and paucity of data both increase uncertainty, as compared to water-table maps from previous quarters, and they are likely the main causes of the absent closed contour.

2.4 Any Operations/Maintenance Activities Performed (Requirement 4)

Extraction, treatment, and injection operations continued during CY 2022 Quarter 4. Operations and maintenance activities completed during CY 2022 Quarter 4 are listed in Table 2.4-1 for the extraction, treatment, and injection system.

**Table 2.4-1
Operations and Maintenance Activity Summary Table – CY 2022 Quarter 4**

Maintenance Date	Elements Impacted	Operation/Maintenance Description
10/1/22 through 10/18/22	CrEX-1, CrEX-2, CrEX-3, CrEX-4, CrEX-5, CTUA, CTUC, CrIN-1, CrIN-2, CrIN-3, CrIN-4, CrIN-5	Extraction, treatment, and injection of treated groundwater occurred per operational plan.
10/18/22	CTUA	IX vessel exchanges were completed as follows because of an increase in the amount of hexavalent chromium at the primary IX vessel effluent as determined via Hach instrument analysis: <ul style="list-style-type: none"> • Treatment train A – replaced primary IX vessel with the secondary IX vessel; new secondary IX vessel installed. • Treatment train B – replaced primary IX vessel with the secondary IX vessel; new secondary IX vessel installed. • Treatment train C – replaced primary IX vessel with the secondary IX vessel; new secondary IX vessel installed. Both influent and all three effluent filter bags replaced.
10/18/22 through 10/27/22	CrEX-1, CrEX-2, CrEX-3, CrEX-4, CrEX-5, CTUA, CTUC, CrIN-1, CrIN-2, CrIN-3, CrIN-4, CrIN-5	Extraction, treatment, and injection of treated groundwater occurred per operational plan.
10/27/22	CrEX-3	CrEX-3 turned off due to improper grounding observed during inspection.
10/28/22	CrEX-1, CrEX-2, CrIN-1, CrIN-2, CrIN-3	CrEX-1 and CrEX-2 turned off due to improper grounding observed during inspection at CrEX-1. CrIN-1, CrIN-2, and CrIN-3 turned off to balance flow.
10/28/22 through 11/2/22	CrEX-4, CrEX-5, CTUA, CTUC, CrIN-4, CrIN-5	Extraction, treatment, and injection of treated groundwater occurred per operational plan.
11/2/22	CTUC	IX vessel exchanges were completed as follows because of an increase in the amount of hexavalent chromium at the primary IX vessel effluent as determined via Hach instrument analysis: <ul style="list-style-type: none"> • Treatment train A – replaced primary IX vessel with the secondary IX vessel; new secondary IX vessel installed. • Treatment train B – replaced primary IX vessel with the secondary IX vessel; new secondary IX vessel installed. Both influent filter bags replaced.
11/2/22 through 11/8/22	CrEX-4, CrEX-5, CTUA, CTUC, CrIN-4, CrIN-5	Extraction, treatment, and injection of treated groundwater occurred per operational plan.

Maintenance Date	Elements Impacted	Operation/Maintenance Description
11/8/22	CTUC	CTUC turned off due to reduced flow rates with CrEX-1, CrEX-2, and CrEX-3 turned off.
11/8/22 through 11/23/22	CrEX-4, CrEX-5, CTUA, CrIN-4, CrIN-5	Extraction, treatment, and injection of treated groundwater occurred per operational plan.
11/23/22	CTUA	IX vessel exchanges were completed as follows because of an increase in the amount of hexavalent chromium at the primary IX vessel effluent as determined via Hach instrument analysis: Treatment train A – replaced primary IX vessel with the secondary IX vessel; new secondary IX vessel installed.
11/23/22 through 12/1/22	CrEX-4, CrEX-5, CTUA, CrIN-4, CrIN-5	Extraction, treatment, and injection of treated groundwater occurred per operational plan.
12/1/22	CTUA	IX vessel exchanges were completed as follows because of an increase in the amount of hexavalent chromium at the primary IX vessel effluent as determined via Hach instrument analysis: <ul style="list-style-type: none"> • Treatment train B – replaced primary IX vessel with the secondary IX vessel; new secondary IX vessel installed. • Treatment train C – replaced primary IX vessel with the secondary IX vessel; new secondary IX vessel installed. Both influent and all three effluent filter bags replaced.
12/1/22 through 12/31/22	CrEX-4, CrEX-5, CTUA, CrIN-4, CrIN-5	Extraction, treatment, and injection of treated groundwater occurred per operational plan.

2.5 Any Periodic Test of Mechanical Integrity Conducted (Requirement 5)

Periodic testing of mechanical integrity was not conducted or reported to NMED during CY 2022 Quarter 4. Mechanical integrity testing was performed and reported to NMED during the CY 2019 Quarter 4 reporting period. In accordance with Condition No. 3, mechanical integrity testing will occur at least once every 5 yr unless a UIC well is reconfigured. Under this scenario, a mechanical integrity test before reinjection of treated effluent at a specific reconfigured well will be completed pursuant to Condition No. 3.

2.6 Any Replacement of Primary or Secondary IX Vessels or Associated Treatment System Infrastructure (Requirement 6)

The primary IX vessels were replaced by the secondary IX vessels, and new secondary IX vessels were installed, at various times for all three treatment trains in CTUA and for both treatment trains in CTUC during the reporting period, as cited in Table 2.4-1.

2.7 Any Well Workovers Conducted (Requirement 7)

No well workovers were conducted during CY 2022 Quarter 4.

2.8 Any Additional Operational Changes with the Potential to Markedly Affect the Discharge (Requirement 8)

During the reporting period, the pilot-scale molasses amendment and sodium dithionite amendment studies continued. In accordance with NMED's conditional approval of these studies, analytical results from iron, manganese, and arsenic testing of the treated water from the extraction wells during the study are provided in the quarterly monitoring reports under DP-1835. These results for CY 2022 Quarter 4 are provided in Table 2.2-2.

No results for arsenic, iron, or manganese exceeded 90% of the numeric standards of 20.6.2.3103 NMAC or 90% of the numeric standards established for tap water in Table A-1 of the 2022 NMED risk assessment guidance (NMED 2022) for constituents not listed in 20.6.2.3103 NMAC. The 90% values for arsenic, iron, and manganese are 9 µg/L, 900 µg/L, and 180 µg/L, respectively.

Other than the activities cited in section 2.4, no additional operational changes occurred during the reporting period.

2.9 Monthly Average, Maximum, and Minimum Values for Flow Rate and Volume of Treated Effluent Transferred to Each UIC Well (Requirement 9)

Table 2.9-1 provides the monthly average, maximum, and minimum values for flow rate and volume of treated effluent transferred to each well in CY 2022 Quarter 4. As noted in Table 2.4-1, CrIN-3, CrIN-4, and CrIN-5 were turned off on October 28, 2022 to balance the injection flow after extraction wells CrEX-1, CrEX-2, and CrEX-3 were shut down due to grounding failures.

**Table 2.9-1
Flows and Volumes of Treated Effluent Injected – CY 2022 Quarter 4, DP-1835**

Injection Well	Flow rate (gpm ^a)			Daily Volume (gal.)			Total Volume (gal.)
	Average ^b	Maximum	Minimum ^c	Average	Maximum	Minimum	
October 2022							
CrIN-1	54.8	60.8	23.5	78,872	87,616	33,776	2,208,402
CrIN-2	57.9	64.7	25.2	83,408	93,230	36,329	2,335,420
CrIN-3	39.2	49.0	16.9	56,468	70,494	24,342	1,581,093
CrIN-4	60.9	73.2	56.0	87,703	105,405	80,649	2,718,797
CrIN-5	60.5	73.5	55.9	87,130	105,797	80,525	2,701,022
November 2022							
CrIN-1	0.0	0.0	0.0	0	0	0	0
CrIN-2	0.0	0.0	0.0	0	0	0	0
CrIN-3	0.0	0.0	0.0	0	0	0	0
CrIN-4	69.5	75.1	65.2	100,068	108,169	93,859	3,002,042
CrIN-5	71.2	74.5	67.5	102,475	107,319	97,165	3,074,240

Table 2.9-1 (continued)

Injection Well	Flow rate (gpm ^a)			Daily Volume (gal.)			Total Volume (gal.)
	Average ^b	Maximum	Minimum ^c	Average	Maximum	Minimum	
December 2022							
CrIN-1	0.0	0.0	0.0	0	0	0	0
CrIN-2	0.0	0.0	0.0	0	0	0	0
CrIN-3	0.0	0.0	0.0	0	0	0	0
CrIN-4	73.1	76.8	68.0	105,239	110,521	97,868	3,262,405
CrIN-5	70.3	74.0	67.2	101,202	106,573	96,761	3,137,260

^a gpm = Gallons per minute.

^b Average flow rate and daily volume represent arithmetic mean values of results provided during periods when treated groundwater was being injected.

^c Minimum values represent the minimum daily value recorded during days when pumping occurred.

2.10 Total Monthly Volume of Treated Effluent Transferred to Each UIC Well (Requirement 10)

Table 2.9-1 provides total monthly volumes of treated effluent transferred to each well. As previously identified, injection occurred at UIC wells CrIN-1 through CrIN-5 during CY 2022 Quarter 4.

2.11 Monthly Average, Maximum, and Minimum Values of Injection Water Level (Pressure Head) Above Static Level for Each UIC Well (Requirement 11)

Table 2.11-1 provides the monthly average, maximum, and minimum values for injection water level above static level for each UIC well.

**Table 2.11-1
Water-Level Values Above Static Level by UIC Well – CY 2022 Quarter 4, DP-1835**

UIC Well	October 2022			November 2022			December 2022		
	Average ^a (ft)	Maximum (ft)	Minimum (ft)	Average (ft)	Maximum (ft)	Minimum (ft)	Average (ft)	Maximum (ft)	Minimum (ft)
CrIN-1	8.5	9.6	0.7	n/a ^b	n/a	n/a	n/a	n/a	n/a
CrIN-2	11.2	13.2	0.0	n/a	n/a	n/a	n/a	n/a	n/a
CrIN-3	3.1	3.8	0.2	n/a	n/a	n/a	n/a	n/a	n/a
CrIN-4	16.3	20.7	6.8	19.2	21.5	16.2	20.2	22.1	9.4
CrIN-5	22.2	28.6	5.3	27.4	30.6	6.7	27.9	30.8	4.5

^a Average values provided represent arithmetic mean values of maximum daily values during periods when treated groundwater was being injected.

^b n/a – not applicable (treated groundwater was not injected during the month at this location).

2.12 Daily Volume Injected at Each UIC Well (Requirement 12)

Daily volumes of groundwater injected (following treatment) during CY 2022 Quarter 4 are presented in Table 2.12-1.

Table 2.12-1
Daily Injection Summary Table – CY 2021 Quarter 4, DP-1835

Date	CrIN-1 (gal.)	CrIN-2 (gal.)	CrIN-3 (gal.)	CrIN-4 (gal.)	CrIN-5 (gal.)	Total (gal.)

2.13 Daily Volume Pumped from Each Extraction Well (Requirement 13)

Daily volumes of groundwater pumped from extraction wells during 2021 Quarter 4 are presented in Table 2.13-1. As noted in Table 2.4-1, CrEX-3 was shut down on October 27, 2022, and CrEX-1 and CrEX-2 were turned off on October 28, 2022, due to grounding failures.

**Table 2.13-1
